[28449] VGAM2035 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2035 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typi-

cal of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[28450] An enzyme complex designated DICER COMPLEX, dices the VGAM2035 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2035 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 57%) nucleotide sequence of VGAM2035 RNA is designated SEQ ID:4746, and is provided hereinbelow with reference to the sequence listing part.

[28451] VGAM2035 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2035 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2035 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding

gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[28452] VGAM2035 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2035 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2035 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2035 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2035 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be lo-

cated in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[28453] The complementary binding of VGAM2035 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2035 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2035 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2035 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[28454] It is appreciated that VGAM2035 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2035 host target genes. The mRNA of each one of this plurality of VGAM2035 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2035 RNA, herein designated VGAM RNA, and which when bound by VGAM2035 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2035 host target proteins.

[28455] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with

specific reference to translational inhibition exerted by VGAM2035 gene, herein designated VGAM GENE, on one or more VGAM2035 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[28456] It is yet further appreciated that a function of VGAM2035 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2035 include diagnosis, prevention and treatment of viral infection by Zaire Ebola virus (ZEBOV). Specific functions, and accordingly utilities, of VGAM2035 correlate with, and may be deduced from, the identity of the host target genes which VGAM2035 binds and in-

hibits, and the function of these host target genes, as elaborated hereinbelow.

[28457] Nucleotide sequences of the VGAM2035 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2035 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2035 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2035 are further described hereinbelow with reference to Table 1.

[28458] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2035 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[28459] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2036 (VGAM2036) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[28460] VGAM2036 is a novel bioinformatically detected regula-

tory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2036 was detected is described hereinabove with reference to Figs. 2-8.

[28461] VGAM2036 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Marburg virus. VGAM2036 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[28462] VGAM2036 gene, herein designated VGAM GENE, encodes a VGAM2036 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2036 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2036 precursor RNA is designated SEQ ID:2022, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2022 is located at position 4709 relative to the genome of Marburg virus.

[28463] VGAM2036 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2036 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure.

As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[28464] An enzyme complex designated DICER COMPLEX, dices the VGAM2036 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2036 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM2036 RNA is designated SEQ ID:4747, and is provided hereinbelow with reference to the sequence listing part.

[28465] VGAM2036 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2036 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2036 host target RNA, herein designated VGAM HOST TARGET RNA, comprises

three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[28466] VGAM2036 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2036 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2036 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2036 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2036 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an

example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[28467] The complementary binding of VGAM2036 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2036 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2036 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2036 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[28468] It is appreciated that VGAM2036 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2036 host target genes. The mRNA of each one of this plurality of VGAM2036 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2036 RNA, herein designated VGAM RNA, and which when bound by VGAM2036 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2036 host target proteins.

[28469] It is further appreciated by one skilled in the art that the

mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2036 gene, herein designated VGAM GENE, on one or more VGAM2036 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[28470] It is yet further appreciated that a function of VGAM2036 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2036 include diagnosis, prevention and treatment of viral infection by Marburg virus. Specific functions, and accordingly utilities, of VGAM2036 correlate with, and may be deduced from, the identity of the

host target genes which VGAM2036 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[28471] Nucleotide sequences of the VGAM2036 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2036 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2036 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2036 are further described hereinbelow with reference to Table 1.

[28472] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2036 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[28473] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2037 (VGAM2037) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[28474] VGAM2037 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2037 was detected is described hereinabove with reference to Figs. 2-8.

[28475] VGAM2037 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Marburg virus. VGAM2037 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[28476] VGAM2037 gene, herein designated VGAM GENE, encodes a VGAM2037 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2037 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2037 precursor RNA is designated SEQ ID:2023, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2023 is located at position 17431 relative to the genome of Marburg virus.

[28477] VGAM2037 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2037 folded precursor RNA, herein designated VGAM FOLDED PRECUR-

SOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[28478] An enzyme complex designated DICER COMPLEX, dices the VGAM2037 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2037 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM2037 RNA is designated SEQ ID:4748, and is provided hereinbelow with reference to the sequence listing part.

[28479] VGAM2037 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2037 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2037 host target RNA,

herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[28480] VGAM2037 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2037 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2037 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2037 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2037 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host tar-

get binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[28481] The complementary binding of VGAM2037 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2037 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2037 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2037 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[28482] It is appreciated that VGAM2037 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2037 host target genes. The mRNA of each one of this plurality of VGAM2037 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2037 RNA, herein designated VGAM RNA, and which when bound by VGAM2037 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2037 host target proteins.

[28483] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2037 gene, herein designated VGAM GENE, on one or more VGAM2037 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[28484] It is yet further appreciated that a function of VGAM2037 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2037 include diagnosis, prevention and treatment of viral infection by Marburg virus. Specific functions, and accordingly utilities, of VGAM2037 corre-

late with, and may be deduced from, the identity of the host target genes which VGAM2037 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[28485] Nucleotide sequences of the VGAM2037 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2037 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2037 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2037 are further described hereinbelow with reference to Table 1.

[28486] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2037 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[28487] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2038 (VGAM2038) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the

art.

[28488] VGAM2038 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2038 was detected is described hereinabove with reference to Figs. 2-8.

[28489] VGAM2038 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Kyuri green mottle mosaic virus. VGAM2038 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[28490] VGAM2038 gene, herein designated VGAM GENE, encodes a VGAM2038 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2038 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2038 precursor RNA is designated SEQ ID:2024, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2024 is located at position 2310 relative to the genome of Kyuri green mottle mosaic virus.

[28491] VGAM2038 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2038 folded

precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[28492] An enzyme complex designated DICER COMPLEX, dices the VGAM2038 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2038 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM2038 RNA is designated SEQ ID:4749, and is provided hereinbelow with reference to the sequence listing part.

[28493] VGAM2038 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2038 host target RNA, herein designated

VGAM HOST TARGET RNA. VGAM2038 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[28494] VGAM2038 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2038 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2038 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2038 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2038 host target RNA, herein designated VGAM HOST TARGET RNA.

It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[28495] The complementary binding of VGAM2038 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2038 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2038 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2038 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[28496] It is appreciated that VGAM2038 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2038 host target genes. The mRNA of each one of this plurality of VGAM2038 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2038 RNA, herein designated VGAM RNA, and which when bound by VGAM2038 RNA, herein designated VGAM RNA, causes inhibition of translation of

respective one or more VGAM2038 host target proteins.

[28497] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2038 gene, herein designated VGAM GENE, on one or more VGAM2038 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[28498] It is yet further appreciated that a function of VGAM2038 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2038 include diagnosis, prevention and treatment of viral infection by Kyuri green mottle mosaic

virus. Specific functions, and accordingly utilities, of VGAM2038 correlate with, and may be deduced from, the identity of the host target genes which VGAM2038 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[28499] Nucleotide sequences of the VGAM2038 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2038 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2038 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2038 are further described hereinbelow with reference to Table 1.

[28500] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2038 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[28501] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2039 (VGAM2039) viral gene, which modulates expression of respective host target genes thereof, the func-

tion and utility of which host target genes is known in the art.

[28502] VGAM2039 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2039 was detected is described hereinabove with reference to Figs. 2-8.

[28503] VGAM2039 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Marburg virus. VGAM2039 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[28504] VGAM2039 gene, herein designated VGAM GENE, encodes a VGAM2039 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2039 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2039 precursor RNA is designated SEQ ID:2025, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2025 is located at position 2481 relative to the genome of Marburg virus.

[28505] VGAM2039 precursor RNA, herein designated VGAM PRE-

CURSOR RNA, folds onto itself, forming VGAM2039 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[28506] An enzyme complex designated DICER COMPLEX, dices the VGAM2039 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2039 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide sequence of VGAM2039 RNA is designated SEQ ID:4750, and is provided hereinbelow with reference to the sequence listing part.

[28507] VGAM2039 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger

RNA, VGAM2039 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2039 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[28508] VGAM2039 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2039 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2039 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2039 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2039 host

target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[28509] The complementary binding of VGAM2039 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2039 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2039 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2039 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[28510] It is appreciated that VGAM2039 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2039 host target genes. The mRNA of each one of this plurality of VGAM2039 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2039 RNA, herein designated VGAM RNA, and which when bound by VGAM2039 RNA, herein

designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2039 host target proteins.

[28511] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2039 gene, herein designated VGAM GENE, on one or more VGAM2039 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[28512] It is yet further appreciated that a function of VGAM2039 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2039 include diagnosis, prevention and

treatment of viral infection by Marburg virus. Specific functions, and accordingly utilities, of VGAM2039 correlate with, and may be deduced from, the identity of the host target genes which VGAM2039 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[28513] Nucleotide sequences of the VGAM2039 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2039 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2039 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2039 are further described hereinbelow with reference to Table 1.

[28514] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2039 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[28515] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2040 (VGAM2040) viral gene, which modulates ex-

pression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[28516] VGAM2040 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2040 was detected is described hereinabove with reference to Figs. 2-8.

[28517] VGAM2040 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Marburg virus. VGAM2040 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[28518] VGAM2040 gene, herein designated VGAM GENE, encodes a VGAM2040 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2040 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2040 precursor RNA is designated SEQ ID:2026, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2026 is located at position 5679 relative to the genome of Marburg virus.

[28519] VGAM2040 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2040 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[28520] An enzyme complex designated DICER COMPLEX, dices the VGAM2040 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2040 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 44%) nucleotide sequence of VGAM2040 RNA is designated SEQ ID:4751, and is provided hereinbelow with reference to the sequence listing part.

[28521] VGAM2040 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2040 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2040 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[28522] VGAM2040 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2040 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2040 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2040 RNA, herein designated VGAM RNA, may have a different number of host target

binding sites in untranslated regions of a VGAM2040 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[28523] The complementary binding of VGAM2040 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2040 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2040 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2040 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[28524] It is appreciated that VGAM2040 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2040 host target genes. The mRNA of each one of this plurality of VGAM2040 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2040 RNA, herein designated VGAM

RNA, and which when bound by VGAM2040 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2040 host target proteins.

[28525] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2040 gene, herein designated VGAM GENE, on one or more VGAM2040 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[28526] It is yet further appreciated that a function of VGAM2040 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly,

utilities of VGAM2040 include diagnosis, prevention and treatment of viral infection by Marburg virus. Specific functions, and accordingly utilities, of VGAM2040 correlate with, and may be deduced from, the identity of the host target genes which VGAM2040 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[28527] Nucleotide sequences of the VGAM2040 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2040 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2040 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2040 are further described hereinbelow with reference to Table 1.

[28528] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2040 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[28529] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Mes-

senger 2041 (VGAM2041) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[28530] VGAM2041 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2041 was detected is described hereinabove with reference to Figs. 2-8.

[28531] VGAM2041 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Marburg virus. VGAM2041 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[28532] VGAM2041 gene, herein designated VGAM GENE, encodes a VGAM2041 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2041 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2041 precursor RNA is designated SEQ ID:2027, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2027 is located at position 9817

relative to the genome of Marburg virus.

[28533] VGAM2041 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2041 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[28534] An enzyme complex designated DICER COMPLEX, dices the VGAM2041 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2041 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of VGAM2041 RNA is designated SEQ ID:4752, and is provided hereinbelow with reference to the sequence listing part.

[28535] VGAM2041 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2041 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2041 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[28536] VGAM2041 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2041 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2041 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2041 RNA, herein designated

VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2041 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[28537] The complementary binding of VGAM2041 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2041 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2041 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2041 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[28538] It is appreciated that VGAM2041 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2041 host target genes. The mRNA of each one of this plurality of VGAM2041 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly com-

plementary to VGAM2041 RNA, herein designated VGAM RNA, and which when bound by VGAM2041 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2041 host target proteins.

[28539] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2041 gene, herein designated VGAM GENE, on one or more VGAM2041 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[28540] It is yet further appreciated that a function of VGAM2041 is inhibition of expression of host target genes, as part of

a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2041 include diagnosis, prevention and treatment of viral infection by Marburg virus. Specific functions, and accordingly utilities, of VGAM2041 correlate with, and may be deduced from, the identity of the host target genes which VGAM2041 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[28541] Nucleotide sequences of the VGAM2041 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2041 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2041 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2041 are further described hereinbelow with reference to Table 1.

[28542] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2041 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[28543] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present

invention, referred to here as Viral Genomic Address Messenger 2042 (VGAM2042) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[28544] VGAM2042 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2042 was detected is described hereinabove with reference to Figs. 2-8.

[28545] VGAM2042 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human herpesvirus 5. VGAM2042 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[28546] VGAM2042 gene, herein designated VGAM GENE, encodes a VGAM2042 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2042 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2042 precursor RNA is designated SEQ ID:2028, and is provided hereinbelow with reference to the sequence listing part. Nu-

cleotide sequence SEQ ID:2028 is located at position 207065 relative to the genome of Human herpesvirus 5.

[28547] VGAM2042 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2042 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[28548] An enzyme complex designated DICER COMPLEX, dices the VGAM2042 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2042 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 50%) nucleotide sequence of VGAM2042 RNA is designated SEQ ID:4753, and is provided hereinbelow with reference to the sequence

listing part.

[28549] VGAM2042 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2042 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2042 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[28550] VGAM2042 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2042 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2042 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not

meant to be limiting VGAM2042 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2042 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[28551] The complementary binding of VGAM2042 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2042 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2042 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2042 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[28552] It is appreciated that VGAM2042 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2042 host target genes. The mRNA of each one of this plurality of VGAM2042 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2042 RNA, herein designated VGAM RNA, and which when bound by VGAM2042 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2042 host target proteins.

[28553] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2042 gene, herein designated VGAM GENE, on one

or more VGAM2042 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[28554] It is yet further appreciated that a function of VGAM2042 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2042 include diagnosis, prevention and treatment of viral infection by Human herpesvirus 5. Specific functions, and accordingly utilities, of VGAM2042 correlate with, and may be deduced from, the identity of the host target genes which VGAM2042 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[28555] Nucleotide sequences of the VGAM2042 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2042 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2042 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2042 are further described hereinbelow with reference to Table 1.

[28556] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2042 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[28557] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2043 (VGAM2043) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[28558] VGAM2043 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2043 was detected is de-

scribed hereinabove with reference to Figs. 2-8.

[28559] VGAM2043 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human herpesvirus 5. VGAM2043 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[28560] VGAM2043 gene, herein designated VGAM GENE, encodes a VGAM2043 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2043 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2043 precursor RNA is designated SEQ ID:2029, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2029 is located at position 200386 relative to the genome of Human herpesvirus 5.

[28561] VGAM2043 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2043 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the

fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[28562] An enzyme complex designated DICER COMPLEX, dices the VGAM2043 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2043 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of VGAM2043 RNA is designated SEQ ID:4754, and is provided hereinbelow with reference to the sequence listing part.

[28563] VGAM2043 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2043 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2043 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and

a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[28564] VGAM2043 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2043 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2043 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2043 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2043 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both

3UTR and 5UTR regions.

[28565] The complementary binding of VGAM2043 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2043 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2043 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2043 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[28566] It is appreciated that VGAM2043 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2043 host target genes. The mRNA of each one of this plurality of VGAM2043 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2043 RNA, herein designated VGAM RNA, and which when bound by VGAM2043 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2043 host target proteins.

[28567] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by

VGAM2043 gene, herein designated VGAM GENE, on one or more VGAM2043 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[28568] It is yet further appreciated that a function of VGAM2043 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2043 include diagnosis, prevention and treatment of viral infection by Human herpesvirus 5. Specific functions, and accordingly utilities, of VGAM2043 correlate with, and may be deduced from, the identity of the host target genes which VGAM2043 binds and inhibits, and the function of these host target genes, as

elaborated hereinbelow.

[28569] Nucleotide sequences of the VGAM2043 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2043 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2043 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2043 are further described hereinbelow with reference to Table 1.

[28570] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2043 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[28571] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2044 (VGAM2044) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[28572] VGAM2044 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene.

The method by which VGAM2044 was detected is described hereinabove with reference to Figs. 2-8.

[28573] VGAM2044 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human herpesvirus 5. VGAM2044 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[28574] VGAM2044 gene, herein designated VGAM GENE, encodes a VGAM2044 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2044 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2044 precursor RNA is designated SEQ ID:2030, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2030 is located at position 212421 relative to the genome of Human herpesvirus 5.

[28575] VGAM2044 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2044 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typi-

cal of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[28576] An enzyme complex designated DICER COMPLEX, dices the VGAM2044 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2044 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 56%) nucleotide sequence of VGAM2044 RNA is designated SEQ ID:4755, and is provided hereinbelow with reference to the sequence listing part.

[28577] VGAM2044 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2044 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2044 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding

gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[28578] VGAM2044 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2044 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2044 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2044 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2044 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be lo-

cated in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[28579] The complementary binding of VGAM2044 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2044 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2044 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2044 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[28580] It is appreciated that VGAM2044 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2044 host target genes. The mRNA of each one of this plurality of VGAM2044 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2044 RNA, herein designated VGAM RNA, and which when bound by VGAM2044 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2044 host target proteins.

[28581] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with

specific reference to translational inhibition exerted by VGAM2044 gene, herein designated VGAM GENE, on one or more VGAM2044 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[28582] It is yet further appreciated that a function of VGAM2044 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2044 include diagnosis, prevention and treatment of viral infection by Human herpesvirus 5. Specific functions, and accordingly utilities, of VGAM2044 correlate with, and may be deduced from, the identity of the host target genes which VGAM2044 binds and in-

hibits, and the function of these host target genes, as elaborated hereinbelow.

[28583] Nucleotide sequences of the VGAM2044 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2044 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2044 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2044 are further described hereinbelow with reference to Table 1.

[28584] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2044 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[28585] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2045 (VGAM2045) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[28586] VGAM2045 is a novel bioinformatically detected regula-

tory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2045 was detected is described hereinabove with reference to Figs. 2-8.

[28587] VGAM2045 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human herpesvirus 5. VGAM2045 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[28588] VGAM2045 gene, herein designated VGAM GENE, encodes a VGAM2045 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2045 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2045 precursor RNA is designated SEQ ID:2031, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2031 is located at position 196544 relative to the genome of Human herpesvirus 5.

[28589] VGAM2045 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2045 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure.

As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[28590] An enzyme complex designated DICER COMPLEX, dices the VGAM2045 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2045 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 44%) nucleotide sequence of VGAM2045 RNA is designated SEQ ID:4756, and is provided hereinbelow with reference to the sequence listing part.

[28591] VGAM2045 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2045 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2045 host target RNA, herein designated VGAM HOST TARGET RNA, comprises

three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[28592] VGAM2045 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2045 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2045 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2045 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2045 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an

example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[28593] The complementary binding of VGAM2045 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2045 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2045 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2045 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[28594] It is appreciated that VGAM2045 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2045 host target genes. The mRNA of each one of this plurality of VGAM2045 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2045 RNA, herein designated VGAM RNA, and which when bound by VGAM2045 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2045 host target proteins.

[28595] It is further appreciated by one skilled in the art that the

mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2045 gene, herein designated VGAM GENE, on one or more VGAM2045 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[28596] It is yet further appreciated that a function of VGAM2045 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2045 include diagnosis, prevention and treatment of viral infection by Human herpesvirus 5. Specific functions, and accordingly utilities, of VGAM2045 correlate with, and may be deduced from, the identity of

the host target genes which VGAM2045 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[28597] Nucleotide sequences of the VGAM2045 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2045 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2045 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2045 are further described hereinbelow with reference to Table 1.

[28598] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2045 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[28599] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2046 (VGAM2046) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[28600] VGAM2046 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2046 was detected is described hereinabove with reference to Figs. 2-8.

[28601] VGAM2046 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human herpesvirus 5. VGAM2046 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[28602] VGAM2046 gene, herein designated VGAM GENE, encodes a VGAM2046 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2046 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2046 precursor RNA is designated SEQ ID:2032, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2032 is located at position 209917 relative to the genome of Human herpesvirus 5.

[28603] VGAM2046 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2046 folded precursor RNA, herein designated VGAM FOLDED PRECUR-

SOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[28604] An enzyme complex designated DICER COMPLEX, dices the VGAM2046 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2046 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 53%) nucleotide sequence of VGAM2046 RNA is designated SEQ ID:4757, and is provided hereinbelow with reference to the sequence listing part.

[28605] VGAM2046 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2046 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2046 host target RNA,

herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[28606] VGAM2046 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2046 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2046 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2046 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2046 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host tar-

get binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[28607] The complementary binding of VGAM2046 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2046 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2046 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2046 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[28608] It is appreciated that VGAM2046 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2046 host target genes. The mRNA of each one of this plurality of VGAM2046 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2046 RNA, herein designated VGAM RNA, and which when bound by VGAM2046 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2046 host target proteins.

[28609] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2046 gene, herein designated VGAM GENE, on one or more VGAM2046 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[28610] It is yet further appreciated that a function of VGAM2046 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2046 include diagnosis, prevention and treatment of viral infection by Human herpesvirus 5. Specific functions, and accordingly utilities, of VGAM2046

correlate with, and may be deduced from, the identity of the host target genes which VGAM2046 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[28611] Nucleotide sequences of the VGAM2046 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2046 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2046 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2046 are further described hereinbelow with reference to Table 1.

[28612] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2046 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[28613] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2047 (VGAM2047) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the

art.

[28614] VGAM2047 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2047 was detected is described hereinabove with reference to Figs. 2-8.

[28615] VGAM2047 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human herpesvirus 5. VGAM2047 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[28616] VGAM2047 gene, herein designated VGAM GENE, encodes a VGAM2047 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2047 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2047 precursor RNA is designated SEQ ID:2033, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2033 is located at position 202249 relative to the genome of Human herpesvirus 5.

[28617] VGAM2047 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2047 folded

precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[28618] An enzyme complex designated DICER COMPLEX, dices the VGAM2047 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2047 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM2047 RNA is designated SEQ ID:4758, and is provided hereinbelow with reference to the sequence listing part.

[28619] VGAM2047 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2047 host target RNA, herein designated

VGAM HOST TARGET RNA. VGAM2047 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[28620] VGAM2047 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2047 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2047 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2047 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2047 host target RNA, herein designated VGAM HOST TARGET RNA.

It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[28621] The complementary binding of VGAM2047 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2047 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2047 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2047 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[28622] It is appreciated that VGAM2047 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2047 host target genes. The mRNA of each one of this plurality of VGAM2047 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2047 RNA, herein designated VGAM RNA, and which when bound by VGAM2047 RNA, herein designated VGAM RNA, causes inhibition of translation of

respective one or more VGAM2047 host target proteins.

[28623] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2047 gene, herein designated VGAM GENE, on one or more VGAM2047 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[28624] It is yet further appreciated that a function of VGAM2047 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2047 include diagnosis, prevention and treatment of viral infection by Human herpesvirus 5. Spe-

cific functions, and accordingly utilities, of VGAM2047 correlate with, and may be deduced from, the identity of the host target genes which VGAM2047 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[28625] Nucleotide sequences of the VGAM2047 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2047 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2047 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2047 are further described hereinbelow with reference to Table 1.

[28626] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2047 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[28627] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2048 (VGAM2048) viral gene, which modulates expression of respective host target genes thereof, the func-

tion and utility of which host target genes is known in the art.

[28628] VGAM2048 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2048 was detected is described hereinabove with reference to Figs. 2-8.

[28629] VGAM2048 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human herpesvirus 5. VGAM2048 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[28630] VGAM2048 gene, herein designated VGAM GENE, encodes a VGAM2048 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2048 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2048 precursor RNA is designated SEQ ID:2034, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2034 is located at position 207766 relative to the genome of Human herpesvirus 5.

[28631] VGAM2048 precursor RNA, herein designated VGAM PRE-

CURSOR RNA, folds onto itself, forming VGAM2048 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[28632] An enzyme complex designated DICER COMPLEX, dices the VGAM2048 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2048 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 46%) nucleotide sequence of VGAM2048 RNA is designated SEQ ID:4759, and is provided hereinbelow with reference to the sequence listing part.

[28633] VGAM2048 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger

RNA, VGAM2048 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2048 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[28634] VGAM2048 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2048 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2048 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2048 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2048 host

target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[28635] The complementary binding of VGAM2048 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2048 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2048 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2048 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[28636] It is appreciated that VGAM2048 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2048 host target genes. The mRNA of each one of this plurality of VGAM2048 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2048 RNA, herein designated VGAM RNA, and which when bound by VGAM2048 RNA, herein

designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2048 host target proteins.

[28637] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2048 gene, herein designated VGAM GENE, on one or more VGAM2048 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[28638] It is yet further appreciated that a function of VGAM2048 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2048 include diagnosis, prevention and

treatment of viral infection by Human herpesvirus 5. Specific functions, and accordingly utilities, of VGAM2048 correlate with, and may be deduced from, the identity of the host target genes which VGAM2048 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[28639] Nucleotide sequences of the VGAM2048 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2048 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2048 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2048 are further described hereinbelow with reference to Table 1.

[28640] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2048 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[28641] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2049 (VGAM2049) viral gene, which modulates ex-

pression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[28642] VGAM2049 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2049 was detected is described hereinabove with reference to Figs. 2-8.

[28643] VGAM2049 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human herpesvirus 5. VGAM2049 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[28644] VGAM2049 gene, herein designated VGAM GENE, encodes a VGAM2049 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2049 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2049 precursor RNA is designated SEQ ID:2035, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2035 is located at position 196060 relative to the genome of Human herpesvirus 5.

[28645] VGAM2049 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2049 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[28646] An enzyme complex designated DICER COMPLEX, dices the VGAM2049 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2049 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of VGAM2049 RNA is designated SEQ ID:4760, and is provided hereinbelow with reference to the sequence listing part.

[28647] VGAM2049 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2049 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2049 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[28648] VGAM2049 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2049 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2049 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2049 RNA, herein designated VGAM RNA, may have a different number of host target

binding sites in untranslated regions of a VGAM2049 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[28649] The complementary binding of VGAM2049 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2049 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2049 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2049 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[28650] It is appreciated that VGAM2049 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2049 host target genes. The mRNA of each one of this plurality of VGAM2049 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2049 RNA, herein designated VGAM

RNA, and which when bound by VGAM2049 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2049 host target proteins.

[28651] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2049 gene, herein designated VGAM GENE, on one or more VGAM2049 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[28652] It is yet further appreciated that a function of VGAM2049 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly,

utilities of VGAM2049 include diagnosis, prevention and treatment of viral infection by Human herpesvirus 5. Specific functions, and accordingly utilities, of VGAM2049 correlate with, and may be deduced from, the identity of the host target genes which VGAM2049 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[28653] Nucleotide sequences of the VGAM2049 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2049 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2049 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2049 are further described hereinbelow with reference to Table 1.

[28654] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2049 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[28655] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Mes-

senger 2050 (VGAM2050) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[28656] VGAM2050 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2050 was detected is described hereinabove with reference to Figs. 2-8.

[28657] VGAM2050 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Ovine adenovirus A. VGAM2050 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[28658] VGAM2050 gene, herein designated VGAM GENE, encodes a VGAM2050 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2050 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2050 precursor RNA is designated SEQ ID:2036, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2036 is located at position

13096 relative to the genome of Ovine adenovirus A.

[28659] VGAM2050 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2050 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[28660] An enzyme complex designated DICER COMPLEX, dices the VGAM2050 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2050 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 50%) nucleotide sequence of VGAM2050 RNA is designated SEQ ID:4761, and is provided hereinbelow with reference to the sequence listing part.

[28661] VGAM2050 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2050 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2050 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[28662] VGAM2050 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2050 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2050 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2050 RNA, herein designated

VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2050 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[28663] The complementary binding of VGAM2050 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2050 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2050 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2050 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[28664] It is appreciated that VGAM2050 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2050 host target genes. The mRNA of each one of this plurality of VGAM2050 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly com-

plementary to VGAM2050 RNA, herein designated VGAM RNA, and which when bound by VGAM2050 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2050 host target proteins.

[28665] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2050 gene, herein designated VGAM GENE, on one or more VGAM2050 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[28666] It is yet further appreciated that a function of VGAM2050 is inhibition of expression of host target genes, as part of

a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2050 include diagnosis, prevention and treatment of viral infection by Ovine adenovirus A. Specific functions, and accordingly utilities, of VGAM2050 correlate with, and may be deduced from, the identity of the host target genes which VGAM2050 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[28667] Nucleotide sequences of the VGAM2050 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2050 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2050 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2050 are further described hereinbelow with reference to Table 1.

[28668] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2050 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[28669] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present

invention, referred to here as Viral Genomic Address Messenger 2051 (VGAM2051) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[28670] VGAM2051 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2051 was detected is described hereinabove with reference to Figs. 2-8.

[28671] VGAM2051 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Ovine adenovirus A. VGAM2051 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[28672] VGAM2051 gene, herein designated VGAM GENE, encodes a VGAM2051 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2051 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2051 precursor RNA is designated SEQ ID:2037, and is provided hereinbelow with reference to the sequence listing part. Nu-

cleotide sequence SEQ ID:2037 is located at position 24505 relative to the genome of Ovine adenovirus A.

[28673] VGAM2051 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2051 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[28674] An enzyme complex designated DICER COMPLEX, dices the VGAM2051 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2051 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of VGAM2051 RNA is designated SEQ ID:4762, and is provided hereinbelow with reference to the sequence

listing part.

[28675] VGAM2051 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2051 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2051 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[28676] VGAM2051 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2051 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2051 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not

meant to be limiting VGAM2051 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2051 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[28677] The complementary binding of VGAM2051 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2051 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2051 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2051 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[28678] It is appreciated that VGAM2051 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2051 host target genes. The mRNA of each one of this plurality of VGAM2051 host target genes comprises one or more host target binding sites, each

having a nucleotide sequence which is at least partly complementary to VGAM2051 RNA, herein designated VGAM RNA, and which when bound by VGAM2051 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2051 host target proteins.

[28679] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2051 gene, herein designated VGAM GENE, on one or more VGAM2051 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[28680] It is yet further appreciated that a function of VGAM2051

is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2051 include diagnosis, prevention and treatment of viral infection by Ovine adenovirus A. Specific functions, and accordingly utilities, of VGAM2051 correlate with, and may be deduced from, the identity of the host target genes which VGAM2051 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[28681] Nucleotide sequences of the VGAM2051 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2051 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2051 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2051 are further described hereinbelow with reference to Table 1.

[28682] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2051 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[28683] Fig. 1 further provides a conceptual description of another

novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2052 (VGAM2052) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[28684] VGAM2052 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2052 was detected is described hereinabove with reference to Figs. 2-8.

[28685] VGAM2052 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Ovine adenovirus A. VGAM2052 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[28686] VGAM2052 gene, herein designated VGAM GENE, encodes a VGAM2052 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2052 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2052 precursor RNA is designated SEQ ID:2038, and is provided here-

inbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2038 is located at position 28963 relative to the genome of Ovine adenovirus A.

[28687] VGAM2052 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2052 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[28688] An enzyme complex designated DICER COMPLEX, dices the VGAM2052 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2052 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 58%) nucleotide sequence of VGAM2052 RNA is designated SEQ ID:4763, and

is provided hereinbelow with reference to the sequence listing part.

[28689] VGAM2052 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2052 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2052 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[28690] VGAM2052 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2052 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2052 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites

shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2052 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2052 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[28691] The complementary binding of VGAM2052 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2052 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2052 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2052 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[28692] It is appreciated that VGAM2052 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2052 host target genes. The mRNA of each one of this plurality of VGAM2052 host target genes

comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2052 RNA, herein designated VGAM RNA, and which when bound by VGAM2052 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2052 host target proteins.

[28693] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2052 gene, herein designated VGAM GENE, on one or more VGAM2052 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[28694] It is yet further appreciated that a function of VGAM2052 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2052 include diagnosis, prevention and treatment of viral infection by Ovine adenovirus A. Specific functions, and accordingly utilities, of VGAM2052 correlate with, and may be deduced from, the identity of the host target genes which VGAM2052 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[28695] Nucleotide sequences of the VGAM2052 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2052 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2052 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2052 are further described hereinbelow with reference to Table 1.

[28696] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2052 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[28697] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2053 (VGAM2053) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[28698] VGAM2053 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2053 was detected is described hereinabove with reference to Figs. 2-8.

[28699] VGAM2053 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Ovine adenovirus A. VGAM2053 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[28700] VGAM2053 gene, herein designated VGAM GENE, encodes a VGAM2053 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2053 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2053 precur-

sor RNA is designated SEQ ID:2039, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2039 is located at position 25948 relative to the genome of Ovine adenovirus A.

[28701] VGAM2053 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2053 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[28702] An enzyme complex designated DICER COMPLEX, dices the VGAM2053 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2053 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 50%) nucleotide se-

quence of VGAM2053 RNA is designated SEQ ID:4764, and is provided hereinbelow with reference to the sequence listing part.

[28703] VGAM2053 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2053 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2053 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[28704] VGAM2053 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2053 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2053 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is ap-

preciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2053 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2053 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[28705] The complementary binding of VGAM2053 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2053 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2053 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2053 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[28706] It is appreciated that VGAM2053 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2053 host target genes. The mRNA of

each one of this plurality of VGAM2053 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2053 RNA, herein designated VGAM RNA, and which when bound by VGAM2053 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2053 host target proteins.

[28707] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2053 gene, herein designated VGAM GENE, on one or more VGAM2053 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science

294,779 (2001)).

[28708] It is yet further appreciated that a function of VGAM2053 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2053 include diagnosis, prevention and treatment of viral infection by Ovine adenovirus A. Specific functions, and accordingly utilities, of VGAM2053 correlate with, and may be deduced from, the identity of the host target genes which VGAM2053 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[28709] Nucleotide sequences of the VGAM2053 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2053 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2053 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2053 are further described hereinbelow with reference to Table 1.

[28710] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2053 RNA, herein designated VGAM RNA, are de-

scribed hereinbelow with reference to Table 2.

[28711] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2054 (VGAM2054) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[28712] VGAM2054 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2054 was detected is described hereinabove with reference to Figs. 2-8.

[28713] VGAM2054 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Ectromelia virus. VGAM2054 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[28714] VGAM2054 gene, herein designated VGAM GENE, encodes a VGAM2054 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2054 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly

similar to the nucleotide sequence of VGAM2054 precursor RNA is designated SEQ ID:2040, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2040 is located at position 2713 relative to the genome of Ectromelia virus.

[28715] VGAM2054 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2054 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[28716] An enzyme complex designated DICER COMPLEX, dices the VGAM2054 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2054 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other

necessary proteins. A probable (over 48%) nucleotide sequence of VGAM2054 RNA is designated SEQ ID:4765, and is provided hereinbelow with reference to the sequence listing part.

[28717] VGAM2054 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2054 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2054 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[28718] VGAM2054 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2054 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2054 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I,

BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2054 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2054 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[28719] The complementary binding of VGAM2054 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2054 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2054 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2054 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[28720] It is appreciated that VGAM2054 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents

a plurality of VGAM2054 host target genes. The mRNA of each one of this plurality of VGAM2054 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2054 RNA, herein designated VGAM RNA, and which when bound by VGAM2054 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2054 host target proteins.

[28721] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2054 gene, herein designated VGAM GENE, on one or more VGAM2054 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[28722] It is yet further appreciated that a function of VGAM2054 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2054 include diagnosis, prevention and treatment of viral infection by Ectromelia virus. Specific functions, and accordingly utilities, of VGAM2054 correlate with, and may be deduced from, the identity of the host target genes which VGAM2054 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[28723] Nucleotide sequences of the VGAM2054 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2054 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2054 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2054 are further described hereinbelow with reference to Table 1.

[28724] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites

to VGAM2054 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[28725] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2055 (VGAM2055) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[28726] VGAM2055 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2055 was detected is described hereinabove with reference to Figs. 2-8.

[28727] VGAM2055 gene, herein designated VGAM GENE, is a viral gene contained in the genome of peanut bud necrosis virus. VGAM2055 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[28728] VGAM2055 gene, herein designated VGAM GENE, encodes a VGAM2055 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2055 precursor RNA, herein designated VGAM PRECURSOR RNA, does not en-

code a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2055 precursor RNA is designated SEQ ID:2041, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2041 is located at position 6690 relative to the genome of peanut bud necrosis virus.

[28729] VGAM2055 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2055 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[28730] An enzyme complex designated DICER COMPLEX, dices the VGAM2055 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2055 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM2055 RNA is designated SEQ ID:4766, and is provided hereinbelow with reference to the sequence listing part.

[28731] VGAM2055 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2055 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2055 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[28732] VGAM2055 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2055 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2055 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3

such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2055 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2055 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[28733] The complementary binding of VGAM2055 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2055 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2055 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2055 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[28734] It is appreciated that VGAM2055 host target gene, herein

designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2055 host target genes. The mRNA of each one of this plurality of VGAM2055 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2055 RNA, herein designated VGAM RNA, and which when bound by VGAM2055 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2055 host target proteins.

[28735] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2055 gene, herein designated VGAM GENE, on one or more VGAM2055 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these

other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[28736] It is yet further appreciated that a function of VGAM2055 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2055 include diagnosis, prevention and treatment of viral infection by peanut bud necrosis virus. Specific functions, and accordingly utilities, of VGAM2055 correlate with, and may be deduced from, the identity of the host target genes which VGAM2055 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[28737] Nucleotide sequences of the VGAM2055 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2055 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2055 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2055 are further described hereinbelow with reference to Table 1.

[28738] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the

complementarity of each of these host target binding sites to VGAM2055 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[28739] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2056 (VGAM2056) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[28740] VGAM2056 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2056 was detected is described hereinabove with reference to Figs. 2-8.

[28741] VGAM2056 gene, herein designated VGAM GENE, is a viral gene contained in the genome of peanut bud necrosis virus. VGAM2056 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[28742] VGAM2056 gene, herein designated VGAM GENE, encodes a VGAM2056 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2056 precursor RNA,

herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2056 precursor RNA is designated SEQ ID:2042, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2042 is located at position 5281 relative to the genome of peanut bud necrosis virus.

[28743] VGAM2056 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2056 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[28744] An enzyme complex designated DICER COMPLEX, dices the VGAM2056 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2056 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short

~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM2056 RNA is designated SEQ ID:4767, and is provided hereinbelow with reference to the sequence listing part.

[28745] VGAM2056 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2056 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2056 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[28746] VGAM2056 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2056 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2056 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host

target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2056 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2056 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[28747] The complementary binding of VGAM2056 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2056 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2056 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2056 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[28748] It is appreciated that VGAM2056 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2056 host target genes. The mRNA of each one of this plurality of VGAM2056 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2056 RNA, herein designated VGAM RNA, and which when bound by VGAM2056 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2056 host target proteins.

[28749] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2056 gene, herein designated VGAM GENE, on one or more VGAM2056 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, al-

though specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[28750] It is yet further appreciated that a function of VGAM2056 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2056 include diagnosis, prevention and treatment of viral infection by peanut bud necrosis virus. Specific functions, and accordingly utilities, of VGAM2056 correlate with, and may be deduced from, the identity of the host target genes which VGAM2056 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[28751] Nucleotide sequences of the VGAM2056 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2056 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2056 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2056 are further described hereinbelow with reference to Table 1.

[28752] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of

Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2056 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[28753] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2057 (VGAM2057) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[28754] VGAM2057 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2057 was detected is described hereinabove with reference to Figs. 2-8.

[28755] VGAM2057 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Ectromelia virus. VGAM2057 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[28756] VGAM2057 gene, herein designated VGAM GENE, encodes a VGAM2057 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and un-

like most ordinary genes, VGAM2057 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2057 precursor RNA is designated SEQ ID:2043, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2043 is located at position 3968 relative to the genome of Ectromelia virus.

[28757] VGAM2057 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2057 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[28758] An enzyme complex designated DICER COMPLEX, dices the VGAM2057 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2057 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a

hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 69%) nucleotide sequence of VGAM2057 RNA is designated SEQ ID:4768, and is provided hereinbelow with reference to the sequence listing part.

[28759] VGAM2057 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2057 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2057 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[28760] VGAM2057 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2057 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2057 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed

sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2057 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2057 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[28761] The complementary binding of VGAM2057 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2057 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2057 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2057 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target

protein is therefore outlined by a broken line.

[28762] It is appreciated that VGAM2057 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2057 host target genes. The mRNA of each one of this plurality of VGAM2057 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2057 RNA, herein designated VGAM RNA, and which when bound by VGAM2057 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2057 host target proteins.

[28763] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2057 gene, herein designated VGAM GENE, on one or more VGAM2057 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate ex-

pression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[28764] It is yet further appreciated that a function of VGAM2057 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2057 include diagnosis, prevention and treatment of viral infection by Ectromelia virus. Specific functions, and accordingly utilities, of VGAM2057 correlate with, and may be deduced from, the identity of the host target genes which VGAM2057 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[28765] Nucleotide sequences of the VGAM2057 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2057 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2057 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2057 are further described hereinbelow with reference to Table 1.

[28766] Nucleotide sequences of host target binding sites, such as

BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2057 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[28767] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2058 (VGAM2058) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[28768] VGAM2058 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2058 was detected is described hereinabove with reference to Figs. 2-8.

[28769] VGAM2058 gene, herein designated VGAM GENE, is a viral gene contained in the genome of peanut bud necrosis virus. VGAM2058 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[28770] VGAM2058 gene, herein designated VGAM GENE, encodes a VGAM2058 precursor RNA, herein designated VGAM

PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2058 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2058 precursor RNA is designated SEQ ID:2044, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2044 is located at position 4967 relative to the genome of peanut bud necrosis virus.

[28771] VGAM2058 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2058 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[28772] An enzyme complex designated DICER COMPLEX, dices the VGAM2058 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2058 RNA, herein designated VGAM RNA, a single stranded ~22 nt

long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 66%) nucleotide sequence of VGAM2058 RNA is designated SEQ ID:4769, and is provided hereinbelow with reference to the sequence listing part.

[28773] VGAM2058 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2058 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2058 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[28774] VGAM2058 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2058 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2058 RNA, herein designated

VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2058 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2058 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[28775] The complementary binding of VGAM2058 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2058 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2058 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2058 host target protein, herein desig-

nated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[28776] It is appreciated that VGAM2058 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2058 host target genes. The mRNA of each one of this plurality of VGAM2058 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2058 RNA, herein designated VGAM RNA, and which when bound by VGAM2058 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2058 host target proteins.

[28777] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2058 gene, herein designated VGAM GENE, on one or more VGAM2058 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are

also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[28778] It is yet further appreciated that a function of VGAM2058 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2058 include diagnosis, prevention and treatment of viral infection by peanut bud necrosis virus. Specific functions, and accordingly utilities, of VGAM2058 correlate with, and may be deduced from, the identity of the host target genes which VGAM2058 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[28779] Nucleotide sequences of the VGAM2058 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2058 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2058 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2058 are further described hereinbelow with reference to Table 1.

[28780] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2058 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[28781] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2059 (VGAM2059) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[28782] VGAM2059 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2059 was detected is described hereinabove with reference to Figs. 2-8.

[28783] VGAM2059 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Ectromelia virus. VGAM2059 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[28784] VGAM2059 gene, herein designated VGAM GENE, encodes

a VGAM2059 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2059 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2059 precursor RNA is designated SEQ ID:2045, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2045 is located at position 15250 relative to the genome of Ectromelia virus.

[28785] VGAM2059 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2059 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[28786] An enzyme complex designated DICER COMPLEX, dices the VGAM2059 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2059 RNA,

herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 44%) nucleotide sequence of VGAM2059 RNA is designated SEQ ID:4770, and is provided hereinbelow with reference to the sequence listing part.

[28787] VGAM2059 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2059 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2059 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[28788] VGAM2059 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2059 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nu-

cleotide sequence of VGAM2059 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2059 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2059 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[28789] The complementary binding of VGAM2059 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2059 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2059 host target RNA, herein designated VGAM HOST TARGET

RNA, into VGAM2059 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[28790] It is appreciated that VGAM2059 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2059 host target genes. The mRNA of each one of this plurality of VGAM2059 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2059 RNA, herein designated VGAM RNA, and which when bound by VGAM2059 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2059 host target proteins.

[28791] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2059 gene, herein designated VGAM GENE, on one or more VGAM2059 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4

and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[28792] It is yet further appreciated that a function of VGAM2059 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2059 include diagnosis, prevention and treatment of viral infection by Ectromelia virus. Specific functions, and accordingly utilities, of VGAM2059 correlate with, and may be deduced from, the identity of the host target genes which VGAM2059 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[28793] Nucleotide sequences of the VGAM2059 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2059 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2059 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2059 are further

described hereinbelow with reference to Table 1.

[28794] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2059 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[28795] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2060 (VGAM2060) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[28796] VGAM2060 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2060 was detected is described hereinabove with reference to Figs. 2-8.

[28797] VGAM2060 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Ectromelia virus. VGAM2060 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[28798] VGAM2060 gene, herein designated VGAM GENE, encodes a VGAM2060 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2060 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2060 precursor RNA is designated SEQ ID:2046, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2046 is located at position 3202 relative to the genome of Ectromelia virus.

[28799] VGAM2060 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2060 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[28800] An enzyme complex designated DICER COMPLEX, dices the VGAM2060 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, into VGAM2060 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 70%) nucleotide sequence of VGAM2060 RNA is designated SEQ ID:4771, and is provided hereinbelow with reference to the sequence listing part.

[28801] VGAM2060 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2060 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2060 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[28802] VGAM2060 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2060 host target RNA, herein designated VGAM HOST TARGET RNA. This

complementary binding is due to the fact that the nucleotide sequence of VGAM2060 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2060 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2060 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[28803] The complementary binding of VGAM2060 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2060 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2060

host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2060 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[28804] It is appreciated that VGAM2060 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2060 host target genes. The mRNA of each one of this plurality of VGAM2060 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2060 RNA, herein designated VGAM RNA, and which when bound by VGAM2060 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2060 host target proteins.

[28805] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2060 gene, herein designated VGAM GENE, on one or more VGAM2060 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated

only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[28806] It is yet further appreciated that a function of VGAM2060 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2060 include diagnosis, prevention and treatment of viral infection by Ectromelia virus. Specific functions, and accordingly utilities, of VGAM2060 correlate with, and may be deduced from, the identity of the host target genes which VGAM2060 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[28807] Nucleotide sequences of the VGAM2060 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2060 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2060 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, of VGAM2060 are further described hereinbelow with reference to Table 1.

[28808] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2060 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[28809] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2061 (VGAM2061) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[28810] VGAM2061 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2061 was detected is described hereinabove with reference to Figs. 2-8.

[28811] VGAM2061 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Ectromelia virus. VGAM2061 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the

human genome.

[28812] VGAM2061 gene, herein designated VGAM GENE, encodes a VGAM2061 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2061 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2061 precursor RNA is designated SEQ ID:2047, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2047 is located at position 132 relative to the genome of Ectromelia virus.

[28813] VGAM2061 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2061 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[28814] An enzyme complex designated DICER COMPLEX, dices

the VGAM2061 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2061 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 45%) nucleotide sequence of VGAM2061 RNA is designated SEQ ID:4772, and is provided hereinbelow with reference to the sequence listing part.

[28815] VGAM2061 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2061 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2061 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[28816] VGAM2061 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2061 host target

RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2061 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2061 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2061 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[28817] The complementary binding of VGAM2061 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2061 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE

II and BINDING SITE III, inhibits translation of VGAM2061 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2061 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[28818] It is appreciated that VGAM2061 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2061 host target genes. The mRNA of each one of this plurality of VGAM2061 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2061 RNA, herein designated VGAM RNA, and which when bound by VGAM2061 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2061 host target proteins.

[28819] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2061 gene, herein designated VGAM GENE, on one or more VGAM2061 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a spe-

cific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[28820] It is yet further appreciated that a function of VGAM2061 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2061 include diagnosis, prevention and treatment of viral infection by Ectromelia virus. Specific functions, and accordingly utilities, of VGAM2061 correlate with, and may be deduced from, the identity of the host target genes which VGAM2061 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[28821] Nucleotide sequences of the VGAM2061 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2061 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of

VGAM2061 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2061 are further described hereinbelow with reference to Table 1.

[28822] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2061 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[28823] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2062 (VGAM2062) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[28824] VGAM2062 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2062 was detected is described hereinabove with reference to Figs. 2-8.

[28825] VGAM2062 gene, herein designated VGAM GENE, is a viral gene contained in the genome of peanut bud necrosis virus. VGAM2062 host target gene, herein designated

VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[28826] VGAM2062 gene, herein designated VGAM GENE, encodes a VGAM2062 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2062 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2062 precursor RNA is designated SEQ ID:2048, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2048 is located at position 345 relative to the genome of peanut bud necrosis virus.

[28827] VGAM2062 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2062 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[28828] An enzyme complex designated DICER COMPLEX, dices the VGAM2062 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2062 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM2062 RNA is designated SEQ ID:4773, and is provided hereinbelow with reference to the sequence listing part.

[28829] VGAM2062 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2062 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2062 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[28830] VGAM2062 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites

located in untranslated regions of VGAM2062 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2062 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2062 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2062 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[28831] The complementary binding of VGAM2062 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2062 host target RNA, herein designated VGAM

HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2062 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2062 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[28832] It is appreciated that VGAM2062 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2062 host target genes. The mRNA of each one of this plurality of VGAM2062 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2062 RNA, herein designated VGAM RNA, and which when bound by VGAM2062 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2062 host target proteins.

[28833] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2062 gene, herein designated VGAM GENE, on one or more VGAM2062 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove

with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[28834] It is yet further appreciated that a function of VGAM2062 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2062 include diagnosis, prevention and treatment of viral infection by peanut bud necrosis virus. Specific functions, and accordingly utilities, of VGAM2062 correlate with, and may be deduced from, the identity of the host target genes which VGAM2062 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[28835] Nucleotide sequences of the VGAM2062 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2062 RNA, herein designated VGAM RNA, and

a schematic representation of the secondary folding of VGAM2062 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2062 are further described hereinbelow with reference to Table 1.

[28836] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2062 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[28837] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2063 (VGAM2063) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[28838] VGAM2063 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2063 was detected is described hereinabove with reference to Figs. 2-8.

[28839] VGAM2063 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Ectromelia virus.

VGAM2063 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[28840] VGAM2063 gene, herein designated VGAM GENE, encodes a VGAM2063 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2063 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2063 precursor RNA is designated SEQ ID:2049, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2049 is located at position 7074 relative to the genome of Ectromelia virus.

[28841] VGAM2063 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2063 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of

the second half thereof.

[28842] An enzyme complex designated DICER COMPLEX, dices the VGAM2063 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2063 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of VGAM2063 RNA is designated SEQ ID:4774, and is provided hereinbelow with reference to the sequence listing part.

[28843] VGAM2063 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2063 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2063 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[28844] VGAM2063 RNA, herein designated VGAM RNA, binds

complementarily to one or more host target binding sites located in untranslated regions of VGAM2063 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2063 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2063 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2063 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[28845] The complementary binding of VGAM2063 RNA, herein designated VGAM RNA, to host target binding sites on

VGAM2063 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2063 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2063 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[28846] It is appreciated that VGAM2063 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2063 host target genes. The mRNA of each one of this plurality of VGAM2063 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2063 RNA, herein designated VGAM RNA, and which when bound by VGAM2063 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2063 host target proteins.

[28847] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2063 gene, herein designated VGAM GENE, on one or more VGAM2063 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other

known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[28848] It is yet further appreciated that a function of VGAM2063 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2063 include diagnosis, prevention and treatment of viral infection by Ectromelia virus. Specific functions, and accordingly utilities, of VGAM2063 correlate with, and may be deduced from, the identity of the host target genes which VGAM2063 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[28849] Nucleotide sequences of the VGAM2063 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the

diced VGAM2063 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2063 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2063 are further described hereinbelow with reference to Table 1.

[28850] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2063 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[28851] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2064 (VGAM2064) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[28852] VGAM2064 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2064 was detected is described hereinabove with reference to Figs. 2-8.

[28853] VGAM2064 gene, herein designated VGAM GENE, is a viral

gene contained in the genome of peanut bud necrosis virus. VGAM2064 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[28854] VGAM2064 gene, herein designated VGAM GENE, encodes a VGAM2064 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2064 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2064 precursor RNA is designated SEQ ID:2050, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2050 is located at position 3726 relative to the genome of peanut bud necrosis virus.

[28855] VGAM2064 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2064 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial

inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[28856] An enzyme complex designated DICER COMPLEX, dices the VGAM2064 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2064 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide sequence of VGAM2064 RNA is designated SEQ ID:4775, and is provided hereinbelow with reference to the sequence listing part.

[28857] VGAM2064 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2064 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2064 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[28858] VGAM2064 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2064 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2064 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2064 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2064 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[28859] The complementary binding of VGAM2064 RNA, herein

designated VGAM RNA, to host target binding sites on VGAM2064 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2064 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2064 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[28860] It is appreciated that VGAM2064 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2064 host target genes. The mRNA of each one of this plurality of VGAM2064 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2064 RNA, herein designated VGAM RNA, and which when bound by VGAM2064 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2064 host target proteins.

[28861] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2064 gene, herein designated VGAM GENE, on one or more VGAM2064 host target gene, herein designated

VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[28862] It is yet further appreciated that a function of VGAM2064 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2064 include diagnosis, prevention and treatment of viral infection by peanut bud necrosis virus. Specific functions, and accordingly utilities, of VGAM2064 correlate with, and may be deduced from, the identity of the host target genes which VGAM2064 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[28863] Nucleotide sequences of the VGAM2064 precursor RNA,

herein designated VGAM PRECURSOR RNA, and of the diced VGAM2064 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2064 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2064 are further described hereinbelow with reference to Table 1.

[28864] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2064 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[28865] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2065 (VGAM2065) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[28866] VGAM2065 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2065 was detected is described hereinabove with reference to Figs. 2-8.

[28867] VGAM2065 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Ectromelia virus. VGAM2065 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[28868] VGAM2065 gene, herein designated VGAM GENE, encodes a VGAM2065 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2065 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2065 precursor RNA is designated SEQ ID:2051, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2051 is located at position 18973 relative to the genome of Ectromelia virus.

[28869] VGAM2065 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2065 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the

RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[28870] An enzyme complex designated DICER COMPLEX, dices the VGAM2065 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2065 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of VGAM2065 RNA is designated SEQ ID:4776, and is provided hereinbelow with reference to the sequence listing part.

[28871] VGAM2065 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2065 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2065 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN COD-

ING and 3UTR respectively.

[28872] VGAM2065 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2065 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2065 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2065 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2065 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[28873] The complementary binding of VGAM2065 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2065 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2065 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2065 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[28874] It is appreciated that VGAM2065 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2065 host target genes. The mRNA of each one of this plurality of VGAM2065 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2065 RNA, herein designated VGAM RNA, and which when bound by VGAM2065 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2065 host target proteins.

[28875] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2065 gene, herein designated VGAM GENE, on one

or more VGAM2065 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[28876] It is yet further appreciated that a function of VGAM2065 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2065 include diagnosis, prevention and treatment of viral infection by Ectromelia virus. Specific functions, and accordingly utilities, of VGAM2065 correlate with, and may be deduced from, the identity of the host target genes which VGAM2065 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[28877] Nucleotide sequences of the VGAM2065 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2065 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2065 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2065 are further described hereinbelow with reference to Table 1.

[28878] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2065 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[28879] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2066 (VGAM2066) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[28880] VGAM2066 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2066 was detected is de-

scribed hereinabove with reference to Figs. 2-8.

[28881] VGAM2066 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Ectromelia virus. VGAM2066 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[28882] VGAM2066 gene, herein designated VGAM GENE, encodes a VGAM2066 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2066 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2066 precursor RNA is designated SEQ ID:2052, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2052 is located at position 9912 relative to the genome of Ectromelia virus.

[28883] VGAM2066 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2066 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the

fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[28884] An enzyme complex designated DICER COMPLEX, dices the VGAM2066 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2066 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM2066 RNA is designated SEQ ID:4777, and is provided hereinbelow with reference to the sequence listing part.

[28885] VGAM2066 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2066 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2066 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and

a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[28886] VGAM2066 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2066 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2066 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2066 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2066 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both

3UTR and 5UTR regions.

[28887] The complementary binding of VGAM2066 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2066 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2066 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2066 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[28888] It is appreciated that VGAM2066 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2066 host target genes. The mRNA of each one of this plurality of VGAM2066 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2066 RNA, herein designated VGAM RNA, and which when bound by VGAM2066 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2066 host target proteins.

[28889] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by

VGAM2066 gene, herein designated VGAM GENE, on one or more VGAM2066 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[28890] It is yet further appreciated that a function of VGAM2066 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2066 include diagnosis, prevention and treatment of viral infection by Ectromelia virus. Specific functions, and accordingly utilities, of VGAM2066 correlate with, and may be deduced from, the identity of the host target genes which VGAM2066 binds and inhibits, and the function of these host target genes, as elaborated

hereinbelow.

[28891] Nucleotide sequences of the VGAM2066 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2066 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2066 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2066 are further described hereinbelow with reference to Table 1.

[28892] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2066 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[28893] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2067 (VGAM2067) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[28894] VGAM2067 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene.

The method by which VGAM2067 was detected is described hereinabove with reference to Figs. 2-8.

[28895] VGAM2067 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Ectromelia virus. VGAM2067 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[28896] VGAM2067 gene, herein designated VGAM GENE, encodes a VGAM2067 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2067 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2067 precursor RNA is designated SEQ ID:2053, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2053 is located at position 7556 relative to the genome of Ectromelia virus.

[28897] VGAM2067 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2067 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typi-

cal of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[28898] An enzyme complex designated DICER COMPLEX, dices the VGAM2067 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2067 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 46%) nucleotide sequence of VGAM2067 RNA is designated SEQ ID:4778, and is provided hereinbelow with reference to the sequence listing part.

[28899] VGAM2067 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2067 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2067 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding

gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[28900] VGAM2067 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2067 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2067 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2067 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2067 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be lo-

cated in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[28901] The complementary binding of VGAM2067 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2067 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2067 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2067 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[28902] It is appreciated that VGAM2067 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2067 host target genes. The mRNA of each one of this plurality of VGAM2067 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2067 RNA, herein designated VGAM RNA, and which when bound by VGAM2067 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2067 host target proteins.

[28903] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with

specific reference to translational inhibition exerted by VGAM2067 gene, herein designated VGAM GENE, on one or more VGAM2067 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[28904] It is yet further appreciated that a function of VGAM2067 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2067 include diagnosis, prevention and treatment of viral infection by Ectromelia virus. Specific functions, and accordingly utilities, of VGAM2067 correlate with, and may be deduced from, the identity of the host target genes which VGAM2067 binds and inhibits,

and the function of these host target genes, as elaborated hereinbelow.

[28905] Nucleotide sequences of the VGAM2067 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2067 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2067 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2067 are further described hereinbelow with reference to Table 1.

[28906] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2067 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[28907] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2068 (VGAM2068) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[28908] VGAM2068 is a novel bioinformatically detected regula-

tory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2068 was detected is described hereinabove with reference to Figs. 2-8.

[28909] VGAM2068 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Monkeypox virus. VGAM2068 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[28910] VGAM2068 gene, herein designated VGAM GENE, encodes a VGAM2068 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2068 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2068 precursor RNA is designated SEQ ID:2054, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2054 is located at position 18952 relative to the genome of Monkeypox virus.

[28911] VGAM2068 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2068 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure.

As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[28912] An enzyme complex designated DICER COMPLEX, dices the VGAM2068 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2068 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM2068 RNA is designated SEQ ID:4779, and is provided hereinbelow with reference to the sequence listing part.

[28913] VGAM2068 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2068 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2068 host target RNA, herein designated VGAM HOST TARGET RNA, comprises

three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[28914] VGAM2068 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2068 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2068 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2068 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2068 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an

example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[28915] The complementary binding of VGAM2068 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2068 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2068 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2068 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[28916] It is appreciated that VGAM2068 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2068 host target genes. The mRNA of each one of this plurality of VGAM2068 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2068 RNA, herein designated VGAM RNA, and which when bound by VGAM2068 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2068 host target proteins.

[28917] It is further appreciated by one skilled in the art that the

mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2068 gene, herein designated VGAM GENE, on one or more VGAM2068 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[28918] It is yet further appreciated that a function of VGAM2068 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2068 include diagnosis, prevention and treatment of viral infection by Monkeypox virus. Specific functions, and accordingly utilities, of VGAM2068 correlate with, and may be deduced from, the identity of the

host target genes which VGAM2068 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[28919] Nucleotide sequences of the VGAM2068 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2068 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2068 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2068 are further described hereinbelow with reference to Table 1.

[28920] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2068 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[28921] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2069 (VGAM2069) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[28922] VGAM2069 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2069 was detected is described hereinabove with reference to Figs. 2-8.

[28923] VGAM2069 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Monkeypox virus. VGAM2069 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[28924] VGAM2069 gene, herein designated VGAM GENE, encodes a VGAM2069 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2069 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2069 precursor RNA is designated SEQ ID:2055, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2055 is located at position 20862 relative to the genome of Monkeypox virus.

[28925] VGAM2069 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2069 folded precursor RNA, herein designated VGAM FOLDED PRECUR-

SOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[28926] An enzyme complex designated DICER COMPLEX, dices the VGAM2069 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2069 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM2069 RNA is designated SEQ ID:4780, and is provided hereinbelow with reference to the sequence listing part.

[28927] VGAM2069 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2069 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2069 host target RNA,

herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[28928] VGAM2069 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2069 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2069 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2069 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2069 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host tar-

get binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[28929] The complementary binding of VGAM2069 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2069 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2069 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2069 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[28930] It is appreciated that VGAM2069 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2069 host target genes. The mRNA of each one of this plurality of VGAM2069 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2069 RNA, herein designated VGAM RNA, and which when bound by VGAM2069 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2069 host target proteins.

[28931] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2069 gene, herein designated VGAM GENE, on one or more VGAM2069 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[28932] It is yet further appreciated that a function of VGAM2069 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2069 include diagnosis, prevention and treatment of viral infection by Monkeypox virus. Specific functions, and accordingly utilities, of VGAM2069 corre-

late with, and may be deduced from, the identity of the host target genes which VGAM2069 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[28933] Nucleotide sequences of the VGAM2069 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2069 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2069 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2069 are further described hereinbelow with reference to Table 1.

[28934] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2069 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[28935] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2070 (VGAM2070) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the

art.

[28936] VGAM2070 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2070 was detected is described hereinabove with reference to Figs. 2-8.

[28937] VGAM2070 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Monkeypox virus. VGAM2070 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[28938] VGAM2070 gene, herein designated VGAM GENE, encodes a VGAM2070 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2070 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2070 precursor RNA is designated SEQ ID:2056, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2056 is located at position 20302 relative to the genome of Monkeypox virus.

[28939] VGAM2070 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2070 folded

precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[28940] An enzyme complex designated DICER COMPLEX, dices the VGAM2070 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2070 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 44%) nucleotide sequence of VGAM2070 RNA is designated SEQ ID:4781, and is provided hereinbelow with reference to the sequence listing part.

[28941] VGAM2070 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2070 host target RNA, herein designated

VGAM HOST TARGET RNA. VGAM2070 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[28942] VGAM2070 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2070 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2070 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2070 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2070 host target RNA, herein designated VGAM HOST TARGET RNA.

It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[28943] The complementary binding of VGAM2070 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2070 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2070 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2070 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[28944] It is appreciated that VGAM2070 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2070 host target genes. The mRNA of each one of this plurality of VGAM2070 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2070 RNA, herein designated VGAM RNA, and which when bound by VGAM2070 RNA, herein designated VGAM RNA, causes inhibition of translation of

respective one or more VGAM2070 host target proteins.

[28945] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2070 gene, herein designated VGAM GENE, on one or more VGAM2070 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[28946] It is yet further appreciated that a function of VGAM2070 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2070 include diagnosis, prevention and treatment of viral infection by Monkeypox virus. Specific

functions, and accordingly utilities, of VGAM2070 correlate with, and may be deduced from, the identity of the host target genes which VGAM2070 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[28947] Nucleotide sequences of the VGAM2070 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2070 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2070 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2070 are further described hereinbelow with reference to Table 1.

[28948] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2070 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[28949] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2071 (VGAM2071) viral gene, which modulates expression of respective host target genes thereof, the func-

tion and utility of which host target genes is known in the art.

[28950] VGAM2071 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2071 was detected is described hereinabove with reference to Figs. 2-8.

[28951] VGAM2071 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Monkeypox virus. VGAM2071 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[28952] VGAM2071 gene, herein designated VGAM GENE, encodes a VGAM2071 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2071 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2071 precursor RNA is designated SEQ ID:2057, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2057 is located at position 28091 relative to the genome of Monkeypox virus.

[28953] VGAM2071 precursor RNA, herein designated VGAM PRE-

CURSOR RNA, folds onto itself, forming VGAM2071 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[28954] An enzyme complex designated DICER COMPLEX, dices the VGAM2071 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2071 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 75%) nucleotide sequence of VGAM2071 RNA is designated SEQ ID:4782, and is provided hereinbelow with reference to the sequence listing part.

[28955] VGAM2071 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger

RNA, VGAM2071 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2071 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[28956] VGAM2071 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2071 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2071 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2071 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2071 host

target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[28957] The complementary binding of VGAM2071 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2071 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2071 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2071 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[28958] It is appreciated that VGAM2071 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2071 host target genes. The mRNA of each one of this plurality of VGAM2071 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2071 RNA, herein designated VGAM RNA, and which when bound by VGAM2071 RNA, herein

designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2071 host target proteins.

[28959] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2071 gene, herein designated VGAM GENE, on one or more VGAM2071 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[28960] It is yet further appreciated that a function of VGAM2071 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2071 include diagnosis, prevention and

treatment of viral infection by Monkeypox virus. Specific functions, and accordingly utilities, of VGAM2071 correlate with, and may be deduced from, the identity of the host target genes which VGAM2071 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[28961] Nucleotide sequences of the VGAM2071 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2071 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2071 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2071 are further described hereinbelow with reference to Table 1.

[28962] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2071 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[28963] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2072 (VGAM2072) viral gene, which modulates ex-

pression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[28964] VGAM2072 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2072 was detected is described hereinabove with reference to Figs. 2-8.

[28965] VGAM2072 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Ectromelia virus. VGAM2072 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[28966] VGAM2072 gene, herein designated VGAM GENE, encodes a VGAM2072 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2072 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2072 precursor RNA is designated SEQ ID:2058, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2058 is located at position 23821 relative to the genome of Ectromelia virus.

[28967] VGAM2072 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2072 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[28968] An enzyme complex designated DICER COMPLEX, dices the VGAM2072 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2072 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 64%) nucleotide sequence of VGAM2072 RNA is designated SEQ ID:4783, and is provided hereinbelow with reference to the sequence listing part.

[28969] VGAM2072 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2072 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2072 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[28970] VGAM2072 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2072 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2072 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2072 RNA, herein designated VGAM RNA, may have a different number of host target

binding sites in untranslated regions of a VGAM2072 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[28971] The complementary binding of VGAM2072 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2072 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2072 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2072 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[28972] It is appreciated that VGAM2072 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2072 host target genes. The mRNA of each one of this plurality of VGAM2072 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2072 RNA, herein designated VGAM

RNA, and which when bound by VGAM2072 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2072 host target proteins.

[28973] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2072 gene, herein designated VGAM GENE, on one or more VGAM2072 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[28974] It is yet further appreciated that a function of VGAM2072 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly,

utilities of VGAM2072 include diagnosis, prevention and treatment of viral infection by Ectromelia virus. Specific functions, and accordingly utilities, of VGAM2072 correlate with, and may be deduced from, the identity of the host target genes which VGAM2072 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[28975] Nucleotide sequences of the VGAM2072 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2072 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2072 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2072 are further described hereinbelow with reference to Table 1.

[28976] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2072 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[28977] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Mes-

senger 2073 (VGAM2073) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[28978] VGAM2073 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2073 was detected is described hereinabove with reference to Figs. 2-8.

[28979] VGAM2073 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Monkeypox virus. VGAM2073 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[28980] VGAM2073 gene, herein designated VGAM GENE, encodes a VGAM2073 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2073 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2073 precursor RNA is designated SEQ ID:2059, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2059 is located at position

16020 relative to the genome of Monkeypox virus.

[28981] VGAM2073 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2073 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[28982] An enzyme complex designated DICER COMPLEX, dices the VGAM2073 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2073 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM2073 RNA is designated SEQ ID:4784, and is provided hereinbelow with reference to the sequence listing part.

[28983] VGAM2073 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2073 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2073 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[28984] VGAM2073 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2073 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2073 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2073 RNA, herein designated

VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2073 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[28985] The complementary binding of VGAM2073 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2073 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2073 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2073 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[28986] It is appreciated that VGAM2073 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2073 host target genes. The mRNA of each one of this plurality of VGAM2073 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly com-

plementary to VGAM2073 RNA, herein designated VGAM RNA, and which when bound by VGAM2073 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2073 host target proteins.

[28987] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2073 gene, herein designated VGAM GENE, on one or more VGAM2073 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[28988] It is yet further appreciated that a function of VGAM2073 is inhibition of expression of host target genes, as part of

a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2073 include diagnosis, prevention and treatment of viral infection by Monkeypox virus. Specific functions, and accordingly utilities, of VGAM2073 correlate with, and may be deduced from, the identity of the host target genes which VGAM2073 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[28989] Nucleotide sequences of the VGAM2073 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2073 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2073 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2073 are further described hereinbelow with reference to Table 1.

[28990] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2073 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[28991] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present

invention, referred to here as Viral Genomic Address Messenger 2074 (VGAM2074) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[28992] VGAM2074 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2074 was detected is described hereinabove with reference to Figs. 2-8.

[28993] VGAM2074 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Monkeypox virus. VGAM2074 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[28994] VGAM2074 gene, herein designated VGAM GENE, encodes a VGAM2074 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2074 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2074 precursor RNA is designated SEQ ID:2060, and is provided hereinbelow with reference to the sequence listing part. Nu-

cleotide sequence SEQ ID:2060 is located at position 25479 relative to the genome of Monkeypox virus.

[28995] VGAM2074 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2074 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[28996] An enzyme complex designated DICER COMPLEX, dices the VGAM2074 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2074 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 46%) nucleotide sequence of VGAM2074 RNA is designated SEQ ID:4785, and is provided hereinbelow with reference to the sequence

listing part.

[28997] VGAM2074 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2074 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2074 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[28998] VGAM2074 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2074 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2074 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not

meant to be limiting VGAM2074 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2074 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[28999] The complementary binding of VGAM2074 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2074 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2074 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2074 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[29000] It is appreciated that VGAM2074 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2074 host target genes. The mRNA of each one of this plurality of VGAM2074 host target genes comprises one or more host target binding sites, each

having a nucleotide sequence which is at least partly complementary to VGAM2074 RNA, herein designated VGAM RNA, and which when bound by VGAM2074 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2074 host target proteins.

[29001] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2074 gene, herein designated VGAM GENE, on one or more VGAM2074 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[29002] It is yet further appreciated that a function of VGAM2074

is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2074 include diagnosis, prevention and treatment of viral infection by Monkeypox virus. Specific functions, and accordingly utilities, of VGAM2074 correlate with, and may be deduced from, the identity of the host target genes which VGAM2074 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[29003] Nucleotide sequences of the VGAM2074 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2074 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2074 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2074 are further described hereinbelow with reference to Table 1.

[29004] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2074 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[29005] Fig. 1 further provides a conceptual description of another

novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2075 (VGAM2075) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[29006] VGAM2075 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2075 was detected is described hereinabove with reference to Figs. 2-8.

[29007] VGAM2075 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Variola virus. VGAM2075 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[29008] VGAM2075 gene, herein designated VGAM GENE, encodes a VGAM2075 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2075 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2075 precursor RNA is designated SEQ ID:2061, and is provided hereinbelow with reference to the sequence listing part. Nu-

cleotide sequence SEQ ID:2061 is located at position 177494 relative to the genome of Variola virus.

[29009] VGAM2075 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2075 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[29010] An enzyme complex designated DICER COMPLEX, dices the VGAM2075 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2075 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 55%) nucleotide sequence of VGAM2075 RNA is designated SEQ ID:4786, and is provided hereinbelow with reference to the sequence

listing part.

[29011] VGAM2075 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2075 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2075 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[29012] VGAM2075 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2075 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2075 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not

meant to be limiting VGAM2075 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2075 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[29013] The complementary binding of VGAM2075 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2075 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2075 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2075 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[29014] It is appreciated that VGAM2075 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2075 host target genes. The mRNA of each one of this plurality of VGAM2075 host target genes comprises one or more host target binding sites, each

having a nucleotide sequence which is at least partly complementary to VGAM2075 RNA, herein designated VGAM RNA, and which when bound by VGAM2075 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2075 host target proteins.

[29015] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2075 gene, herein designated VGAM GENE, on one or more VGAM2075 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[29016] It is yet further appreciated that a function of VGAM2075

is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2075 include diagnosis, prevention and treatment of viral infection by Variola virus. Specific functions, and accordingly utilities, of VGAM2075 correlate with, and may be deduced from, the identity of the host target genes which VGAM2075 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[29017] Nucleotide sequences of the VGAM2075 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2075 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2075 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2075 are further described hereinbelow with reference to Table 1.

[29018] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2075 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[29019] Fig. 1 further provides a conceptual description of another

novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2076 (VGAM2076) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[29020] VGAM2076 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2076 was detected is described hereinabove with reference to Figs. 2-8.

[29021] VGAM2076 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Variola virus. VGAM2076 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[29022] VGAM2076 gene, herein designated VGAM GENE, encodes a VGAM2076 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2076 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2076 precursor RNA is designated SEQ ID:2062, and is provided hereinbelow with reference to the sequence listing part. Nu-

cleotide sequence SEQ ID:2062 is located at position 175023 relative to the genome of Variola virus.

[29023] VGAM2076 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2076 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[29024] An enzyme complex designated DICER COMPLEX, dices the VGAM2076 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2076 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM2076 RNA is designated SEQ ID:4787, and is provided hereinbelow with reference to the sequence

listing part.

[29025] VGAM2076 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2076 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2076 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[29026] VGAM2076 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2076 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2076 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not

meant to be limiting VGAM2076 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2076 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[29027] The complementary binding of VGAM2076 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2076 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2076 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2076 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[29028] It is appreciated that VGAM2076 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2076 host target genes. The mRNA of each one of this plurality of VGAM2076 host target genes comprises one or more host target binding sites, each

having a nucleotide sequence which is at least partly complementary to VGAM2076 RNA, herein designated VGAM RNA, and which when bound by VGAM2076 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2076 host target proteins.

[29029] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2076 gene, herein designated VGAM GENE, on one or more VGAM2076 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[29030] It is yet further appreciated that a function of VGAM2076

is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2076 include diagnosis, prevention and treatment of viral infection by Variola virus. Specific functions, and accordingly utilities, of VGAM2076 correlate with, and may be deduced from, the identity of the host target genes which VGAM2076 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[29031] Nucleotide sequences of the VGAM2076 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2076 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2076 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2076 are further described hereinbelow with reference to Table 1.

[29032] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2076 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[29033] Fig. 1 further provides a conceptual description of another

novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2077 (VGAM2077) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[29034] VGAM2077 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2077 was detected is described hereinabove with reference to Figs. 2-8.

[29035] VGAM2077 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Variola virus. VGAM2077 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[29036] VGAM2077 gene, herein designated VGAM GENE, encodes a VGAM2077 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2077 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2077 precursor RNA is designated SEQ ID:2063, and is provided hereinbelow with reference to the sequence listing part. Nu-

cleotide sequence SEQ ID:2063 is located at position 178760 relative to the genome of Variola virus.

[29037] VGAM2077 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2077 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[29038] An enzyme complex designated DICER COMPLEX, dices the VGAM2077 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2077 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM2077 RNA is designated SEQ ID:4788, and is provided hereinbelow with reference to the sequence

listing part.

[29039] VGAM2077 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2077 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2077 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[29040] VGAM2077 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2077 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2077 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not

meant to be limiting VGAM2077 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2077 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[29041] The complementary binding of VGAM2077 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2077 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2077 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2077 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[29042] It is appreciated that VGAM2077 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2077 host target genes. The mRNA of each one of this plurality of VGAM2077 host target genes comprises one or more host target binding sites, each

having a nucleotide sequence which is at least partly complementary to VGAM2077 RNA, herein designated VGAM RNA, and which when bound by VGAM2077 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2077 host target proteins.

[29043] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2077 gene, herein designated VGAM GENE, on one or more VGAM2077 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[29044] It is yet further appreciated that a function of VGAM2077

is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2077 include diagnosis, prevention and treatment of viral infection by Variola virus. Specific functions, and accordingly utilities, of VGAM2077 correlate with, and may be deduced from, the identity of the host target genes which VGAM2077 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[29045] Nucleotide sequences of the VGAM2077 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2077 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2077 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2077 are further described hereinbelow with reference to Table 1.

[29046] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2077 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[29047] Fig. 1 further provides a conceptual description of another

novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2078 (VGAM2078) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[29048] VGAM2078 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2078 was detected is described hereinabove with reference to Figs. 2-8.

[29049] VGAM2078 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Variola virus. VGAM2078 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[29050] VGAM2078 gene, herein designated VGAM GENE, encodes a VGAM2078 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2078 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2078 precursor RNA is designated SEQ ID:2064, and is provided hereinbelow with reference to the sequence listing part. Nu-

cleotide sequence SEQ ID:2064 is located at position 168720 relative to the genome of Variola virus.

[29051] VGAM2078 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2078 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[29052] An enzyme complex designated DICER COMPLEX, dices the VGAM2078 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2078 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 66%) nucleotide sequence of VGAM2078 RNA is designated SEQ ID:4789, and is provided hereinbelow with reference to the sequence

listing part.

[29053] VGAM2078 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2078 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2078 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[29054] VGAM2078 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2078 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2078 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not

meant to be limiting VGAM2078 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2078 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[29055] The complementary binding of VGAM2078 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2078 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2078 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2078 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[29056] It is appreciated that VGAM2078 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2078 host target genes. The mRNA of each one of this plurality of VGAM2078 host target genes comprises one or more host target binding sites, each

having a nucleotide sequence which is at least partly complementary to VGAM2078 RNA, herein designated VGAM RNA, and which when bound by VGAM2078 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2078 host target proteins.

[29057] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2078 gene, herein designated VGAM GENE, on one or more VGAM2078 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[29058] It is yet further appreciated that a function of VGAM2078

is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2078 include diagnosis, prevention and treatment of viral infection by Variola virus. Specific functions, and accordingly utilities, of VGAM2078 correlate with, and may be deduced from, the identity of the host target genes which VGAM2078 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[29059] Nucleotide sequences of the VGAM2078 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2078 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2078 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2078 are further described hereinbelow with reference to Table 1.

[29060] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2078 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[29061] Fig. 1 further provides a conceptual description of another

novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2079 (VGAM2079) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[29062] VGAM2079 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2079 was detected is described hereinabove with reference to Figs. 2-8.

[29063] VGAM2079 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Variola virus. VGAM2079 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[29064] VGAM2079 gene, herein designated VGAM GENE, encodes a VGAM2079 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2079 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2079 precursor RNA is designated SEQ ID:2065, and is provided hereinbelow with reference to the sequence listing part. Nu-

cleotide sequence SEQ ID:2065 is located at position 171525 relative to the genome of Variola virus.

[29065] VGAM2079 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2079 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[29066] An enzyme complex designated DICER COMPLEX, dices the VGAM2079 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2079 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 48%) nucleotide sequence of VGAM2079 RNA is designated SEQ ID:4790, and is provided hereinbelow with reference to the sequence

listing part.

[29067] VGAM2079 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2079 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2079 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[29068] VGAM2079 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2079 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2079 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not

meant to be limiting VGAM2079 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2079 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[29069] The complementary binding of VGAM2079 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2079 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2079 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2079 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[29070] It is appreciated that VGAM2079 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2079 host target genes. The mRNA of each one of this plurality of VGAM2079 host target genes comprises one or more host target binding sites, each

having a nucleotide sequence which is at least partly complementary to VGAM2079 RNA, herein designated VGAM RNA, and which when bound by VGAM2079 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2079 host target proteins.

[29071] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2079 gene, herein designated VGAM GENE, on one or more VGAM2079 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[29072] It is yet further appreciated that a function of VGAM2079

is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2079 include diagnosis, prevention and treatment of viral infection by Variola virus. Specific functions, and accordingly utilities, of VGAM2079 correlate with, and may be deduced from, the identity of the host target genes which VGAM2079 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[29073] Nucleotide sequences of the VGAM2079 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2079 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2079 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2079 are further described hereinbelow with reference to Table 1.

[29074] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2079 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[29075] Fig. 1 further provides a conceptual description of another

novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2080 (VGAM2080) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[29076] VGAM2080 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2080 was detected is described hereinabove with reference to Figs. 2-8.

[29077] VGAM2080 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Variola virus. VGAM2080 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[29078] VGAM2080 gene, herein designated VGAM GENE, encodes a VGAM2080 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2080 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2080 precursor RNA is designated SEQ ID:2066, and is provided hereinbelow with reference to the sequence listing part. Nu-

cleotide sequence SEQ ID:2066 is located at position 176691 relative to the genome of Variola virus.

[29079] VGAM2080 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2080 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[29080] An enzyme complex designated DICER COMPLEX, dices the VGAM2080 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2080 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of VGAM2080 RNA is designated SEQ ID:4791, and is provided hereinbelow with reference to the sequence

listing part.

[29081] VGAM2080 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2080 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2080 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[29082] VGAM2080 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2080 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2080 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not

meant to be limiting VGAM2080 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2080 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[29083] The complementary binding of VGAM2080 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2080 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2080 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2080 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[29084] It is appreciated that VGAM2080 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2080 host target genes. The mRNA of each one of this plurality of VGAM2080 host target genes comprises one or more host target binding sites, each

having a nucleotide sequence which is at least partly complementary to VGAM2080 RNA, herein designated VGAM RNA, and which when bound by VGAM2080 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2080 host target proteins.

[29085] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2080 gene, herein designated VGAM GENE, on one or more VGAM2080 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[29086] It is yet further appreciated that a function of VGAM2080

is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2080 include diagnosis, prevention and treatment of viral infection by Variola virus. Specific functions, and accordingly utilities, of VGAM2080 correlate with, and may be deduced from, the identity of the host target genes which VGAM2080 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[29087] Nucleotide sequences of the VGAM2080 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2080 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2080 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2080 are further described hereinbelow with reference to Table 1.

[29088] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2080 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[29089] Fig. 1 further provides a conceptual description of another

novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2081 (VGAM2081) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[29090] VGAM2081 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2081 was detected is described hereinabove with reference to Figs. 2-8.

[29091] VGAM2081 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Variola virus. VGAM2081 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[29092] VGAM2081 gene, herein designated VGAM GENE, encodes a VGAM2081 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2081 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2081 precursor RNA is designated SEQ ID:2067, and is provided hereinbelow with reference to the sequence listing part. Nu-

cleotide sequence SEQ ID:2067 is located at position 180298 relative to the genome of Variola virus.

[29093] VGAM2081 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2081 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[29094] An enzyme complex designated DICER COMPLEX, dices the VGAM2081 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2081 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 45%) nucleotide sequence of VGAM2081 RNA is designated SEQ ID:4792, and is provided hereinbelow with reference to the sequence

listing part.

[29095] VGAM2081 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2081 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2081 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[29096] VGAM2081 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2081 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2081 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not

meant to be limiting VGAM2081 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2081 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[29097] The complementary binding of VGAM2081 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2081 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2081 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2081 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[29098] It is appreciated that VGAM2081 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2081 host target genes. The mRNA of each one of this plurality of VGAM2081 host target genes comprises one or more host target binding sites, each

having a nucleotide sequence which is at least partly complementary to VGAM2081 RNA, herein designated VGAM RNA, and which when bound by VGAM2081 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2081 host target proteins.

[29099] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2081 gene, herein designated VGAM GENE, on one or more VGAM2081 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[29100] It is yet further appreciated that a function of VGAM2081

is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2081 include diagnosis, prevention and treatment of viral infection by Variola virus. Specific functions, and accordingly utilities, of VGAM2081 correlate with, and may be deduced from, the identity of the host target genes which VGAM2081 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[29101] Nucleotide sequences of the VGAM2081 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2081 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2081 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2081 are further described hereinbelow with reference to Table 1.

[29102] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2081 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[29103] Fig. 1 further provides a conceptual description of another

novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2082 (VGAM2082) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[29104] VGAM2082 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2082 was detected is described hereinabove with reference to Figs. 2-8.

[29105] VGAM2082 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Variola virus. VGAM2082 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[29106] VGAM2082 gene, herein designated VGAM GENE, encodes a VGAM2082 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2082 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2082 precursor RNA is designated SEQ ID:2068, and is provided hereinbelow with reference to the sequence listing part. Nu-

cleotide sequence SEQ ID:2068 is located at position 174739 relative to the genome of Variola virus.

[29107] VGAM2082 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2082 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[29108] An enzyme complex designated DICER COMPLEX, dices the VGAM2082 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2082 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 46%) nucleotide sequence of VGAM2082 RNA is designated SEQ ID:4793, and is provided hereinbelow with reference to the sequence

listing part.

[29109] VGAM2082 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2082 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2082 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[29110] VGAM2082 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2082 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2082 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not

meant to be limiting VGAM2082 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2082 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[29111] The complementary binding of VGAM2082 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2082 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2082 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2082 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[29112] It is appreciated that VGAM2082 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2082 host target genes. The mRNA of each one of this plurality of VGAM2082 host target genes comprises one or more host target binding sites, each

having a nucleotide sequence which is at least partly complementary to VGAM2082 RNA, herein designated VGAM RNA, and which when bound by VGAM2082 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2082 host target proteins.

[29113] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2082 gene, herein designated VGAM GENE, on one or more VGAM2082 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[29114] It is yet further appreciated that a function of VGAM2082

is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2082 include diagnosis, prevention and treatment of viral infection by Variola virus. Specific functions, and accordingly utilities, of VGAM2082 correlate with, and may be deduced from, the identity of the host target genes which VGAM2082 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[29115] Nucleotide sequences of the VGAM2082 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2082 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2082 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2082 are further described hereinbelow with reference to Table 1.

[29116] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2082 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[29117] Fig. 1 further provides a conceptual description of another

novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2083 (VGAM2083) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[29118] VGAM2083 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2083 was detected is described hereinabove with reference to Figs. 2-8.

[29119] VGAM2083 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Camelpox virus. VGAM2083 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[29120] VGAM2083 gene, herein designated VGAM GENE, encodes a VGAM2083 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2083 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2083 precursor RNA is designated SEQ ID:2069, and is provided here-

inbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2069 is located at position 190806 relative to the genome of Camelpox virus.

[29121] VGAM2083 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2083 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[29122] An enzyme complex designated DICER COMPLEX, dices the VGAM2083 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2083 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 44%) nucleotide sequence of VGAM2083 RNA is designated SEQ ID:4794, and

is provided hereinbelow with reference to the sequence listing part.

[29123] VGAM2083 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2083 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2083 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[29124] VGAM2083 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2083 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2083 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites

shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2083 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2083 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[29125] The complementary binding of VGAM2083 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2083 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2083 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2083 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[29126] It is appreciated that VGAM2083 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2083 host target genes. The mRNA of each one of this plurality of VGAM2083 host target genes

comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2083 RNA, herein designated VGAM RNA, and which when bound by VGAM2083 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2083 host target proteins.

[29127] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2083 gene, herein designated VGAM GENE, on one or more VGAM2083 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[29128] It is yet further appreciated that a function of VGAM2083 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2083 include diagnosis, prevention and treatment of viral infection by Camelpox virus. Specific functions, and accordingly utilities, of VGAM2083 correlate with, and may be deduced from, the identity of the host target genes which VGAM2083 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[29129] Nucleotide sequences of the VGAM2083 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2083 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2083 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2083 are further described hereinbelow with reference to Table 1.

[29130] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2083 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[29131] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2084 (VGAM2084) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[29132] VGAM2084 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2084 was detected is described hereinabove with reference to Figs. 2-8.

[29133] VGAM2084 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Variola virus. VGAM2084 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[29134] VGAM2084 gene, herein designated VGAM GENE, encodes a VGAM2084 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2084 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2084 precursor RNA is designated SEQ ID:2070, and is provided here-

inbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2070 is located at position 170712 relative to the genome of Variola virus.

[29135] VGAM2084 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2084 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[29136] An enzyme complex designated DICER COMPLEX, dices the VGAM2084 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2084 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 48%) nucleotide sequence of VGAM2084 RNA is designated SEQ ID:4795, and

is provided hereinbelow with reference to the sequence listing part.

[29137] VGAM2084 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2084 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2084 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[29138] VGAM2084 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2084 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2084 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites

shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2084 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2084 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[29139] The complementary binding of VGAM2084 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2084 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2084 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2084 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[29140] It is appreciated that VGAM2084 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2084 host target genes. The mRNA of each one of this plurality of VGAM2084 host target genes

comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2084 RNA, herein designated VGAM RNA, and which when bound by VGAM2084 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2084 host target proteins.

[29141] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2084 gene, herein designated VGAM GENE, on one or more VGAM2084 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[29142] It is yet further appreciated that a function of VGAM2084 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2084 include diagnosis, prevention and treatment of viral infection by Variola virus. Specific functions, and accordingly utilities, of VGAM2084 correlate with, and may be deduced from, the identity of the host target genes which VGAM2084 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[29143] Nucleotide sequences of the VGAM2084 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2084 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2084 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2084 are further described hereinbelow with reference to Table 1.

[29144] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2084 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[29145] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2085 (VGAM2085) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[29146] VGAM2085 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2085 was detected is described hereinabove with reference to Figs. 2-8.

[29147] VGAM2085 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Fowlpox virus.
VGAM2085 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[29148] VGAM2085 gene, herein designated VGAM GENE, encodes a VGAM2085 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2085 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2085 precur-

sor RNA is designated SEQ ID:2071, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2071 is located at position 96465 relative to the genome of Fowlpox virus.

[29149] VGAM2085 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2085 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[29150] An enzyme complex designated DICER COMPLEX, dices the VGAM2085 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2085 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 50%) nucleotide se-

quence of VGAM2085 RNA is designated SEQ ID:4796, and is provided hereinbelow with reference to the sequence listing part.

[29151] VGAM2085 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2085 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2085 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[29152] VGAM2085 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2085 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2085 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is ap-

preciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2085 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2085 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[29153] The complementary binding of VGAM2085 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2085 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2085 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2085 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[29154] It is appreciated that VGAM2085 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2085 host target genes. The mRNA of

each one of this plurality of VGAM2085 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2085 RNA, herein designated VGAM RNA, and which when bound by VGAM2085 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2085 host target proteins.

[29155] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2085 gene, herein designated VGAM GENE, on one or more VGAM2085 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science

294,779 (2001)).

[29156] It is yet further appreciated that a function of VGAM2085 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2085 include diagnosis, prevention and treatment of viral infection by Fowlpox virus. Specific functions, and accordingly utilities, of VGAM2085 correlate with, and may be deduced from, the identity of the host target genes which VGAM2085 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[29157] Nucleotide sequences of the VGAM2085 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2085 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2085 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2085 are further described hereinbelow with reference to Table 1.

[29158] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2085 RNA, herein designated VGAM RNA, are de-

scribed hereinbelow with reference to Table 2.

[29159] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2086 (VGAM2086) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[29160] VGAM2086 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2086 was detected is described hereinabove with reference to Figs. 2-8.

[29161] VGAM2086 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Fowlpox virus. VGAM2086 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[29162] VGAM2086 gene, herein designated VGAM GENE, encodes a VGAM2086 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2086 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly

similar to the nucleotide sequence of VGAM2086 precursor RNA is designated SEQ ID:2072, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2072 is located at position 106213 relative to the genome of Fowlpox virus.

[29163] VGAM2086 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2086 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[29164] An enzyme complex designated DICER COMPLEX, dices the VGAM2086 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2086 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other

necessary proteins. A probable (over 79%) nucleotide sequence of VGAM2086 RNA is designated SEQ ID:4797, and is provided hereinbelow with reference to the sequence listing part.

[29165] VGAM2086 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2086 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2086 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[29166] VGAM2086 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2086 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2086 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I,

BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2086 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2086 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[29167] The complementary binding of VGAM2086 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2086 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2086 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2086 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[29168] It is appreciated that VGAM2086 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents

a plurality of VGAM2086 host target genes. The mRNA of each one of this plurality of VGAM2086 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2086 RNA, herein designated VGAM RNA, and which when bound by VGAM2086 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2086 host target proteins.

[29169] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2086 gene, herein designated VGAM GENE, on one or more VGAM2086 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[29170] It is yet further appreciated that a function of VGAM2086 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2086 include diagnosis, prevention and treatment of viral infection by Fowlpox virus. Specific functions, and accordingly utilities, of VGAM2086 correlate with, and may be deduced from, the identity of the host target genes which VGAM2086 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[29171] Nucleotide sequences of the VGAM2086 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2086 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2086 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2086 are further described hereinbelow with reference to Table 1.

[29172] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites

to VGAM2086 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[29173] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2087 (VGAM2087) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[29174] VGAM2087 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2087 was detected is described hereinabove with reference to Figs. 2-8.

[29175] VGAM2087 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Fowlpox virus. VGAM2087 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[29176] VGAM2087 gene, herein designated VGAM GENE, encodes a VGAM2087 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2087 precursor RNA, herein designated VGAM PRECURSOR RNA, does not en-

code a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2087 precursor RNA is designated SEQ ID:2073, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2073 is located at position 115039 relative to the genome of Fowlpox virus.

[29177] VGAM2087 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2087 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[29178] An enzyme complex designated DICER COMPLEX, dices the VGAM2087 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2087 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer together with other necessary proteins. A probable (over 59%) nucleotide sequence of VGAM2087 RNA is designated SEQ ID:4798, and is provided hereinbelow with reference to the sequence listing part.

[29179] VGAM2087 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2087 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2087 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[29180] VGAM2087 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2087 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2087 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3

such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2087 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2087 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[29181] The complementary binding of VGAM2087 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2087 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2087 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2087 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[29182] It is appreciated that VGAM2087 host target gene, herein

designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2087 host target genes. The mRNA of each one of this plurality of VGAM2087 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2087 RNA, herein designated VGAM RNA, and which when bound by VGAM2087 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2087 host target proteins.

[29183] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2087 gene, herein designated VGAM GENE, on one or more VGAM2087 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these

other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[29184] It is yet further appreciated that a function of VGAM2087 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2087 include diagnosis, prevention and treatment of viral infection by Fowlpox virus. Specific functions, and accordingly utilities, of VGAM2087 correlate with, and may be deduced from, the identity of the host target genes which VGAM2087 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[29185] Nucleotide sequences of the VGAM2087 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2087 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2087 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2087 are further described hereinbelow with reference to Table 1.

[29186] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the

complementarity of each of these host target binding sites to VGAM2087 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[29187] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2088 (VGAM2088) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[29188] VGAM2088 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2088 was detected is described hereinabove with reference to Figs. 2-8.

[29189] VGAM2088 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Fowlpox virus. VGAM2088 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[29190] VGAM2088 gene, herein designated VGAM GENE, encodes a VGAM2088 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2088 precursor RNA,

herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2088 precursor RNA is designated SEQ ID:2074, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2074 is located at position 97767 relative to the genome of Fowlpox virus.

[29191] VGAM2088 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2088 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[29192] An enzyme complex designated DICER COMPLEX, dices the VGAM2088 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2088 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short

~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 46%) nucleotide sequence of VGAM2088 RNA is designated SEQ ID:4799, and is provided hereinbelow with reference to the sequence listing part.

[29193] VGAM2088 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2088 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2088 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[29194] VGAM2088 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2088 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2088 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host

target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2088 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2088 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[29195] The complementary binding of VGAM2088 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2088 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2088 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2088 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[29196] It is appreciated that VGAM2088 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2088 host target genes. The mRNA of each one of this plurality of VGAM2088 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2088 RNA, herein designated VGAM RNA, and which when bound by VGAM2088 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2088 host target proteins.

[29197] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2088 gene, herein designated VGAM GENE, on one or more VGAM2088 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, al-

though specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[29198] It is yet further appreciated that a function of VGAM2088 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2088 include diagnosis, prevention and treatment of viral infection by Fowlpox virus. Specific functions, and accordingly utilities, of VGAM2088 correlate with, and may be deduced from, the identity of the host target genes which VGAM2088 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[29199] Nucleotide sequences of the VGAM2088 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2088 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2088 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2088 are further described hereinbelow with reference to Table 1.

[29200] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of

Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2088 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[29201] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2089 (VGAM2089) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[29202] VGAM2089 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2089 was detected is described hereinabove with reference to Figs. 2-8.

[29203] VGAM2089 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Fowlpox virus. VGAM2089 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[29204] VGAM2089 gene, herein designated VGAM GENE, encodes a VGAM2089 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and un-

like most ordinary genes, VGAM2089 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2089 precursor RNA is designated SEQ ID:2075, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2075 is located at position 103219 relative to the genome of Fowlpox virus.

[29205] VGAM2089 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2089 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[29206] An enzyme complex designated DICER COMPLEX, dices the VGAM2089 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2089 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a

hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM2089 RNA is designated SEQ ID:4800, and is provided hereinbelow with reference to the sequence listing part.

[29207] VGAM2089 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2089 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2089 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[29208] VGAM2089 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2089 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2089 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed

sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2089 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2089 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[29209] The complementary binding of VGAM2089 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2089 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2089 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2089 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target

protein is therefore outlined by a broken line.

[29210] It is appreciated that VGAM2089 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2089 host target genes. The mRNA of each one of this plurality of VGAM2089 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2089 RNA, herein designated VGAM RNA, and which when bound by VGAM2089 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2089 host target proteins.

[29211] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2089 gene, herein designated VGAM GENE, on one or more VGAM2089 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate ex-

pression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[29212] It is yet further appreciated that a function of VGAM2089 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2089 include diagnosis, prevention and treatment of viral infection by Fowlpox virus. Specific functions, and accordingly utilities, of VGAM2089 correlate with, and may be deduced from, the identity of the host target genes which VGAM2089 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[29213] Nucleotide sequences of the VGAM2089 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2089 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2089 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2089 are further described hereinbelow with reference to Table 1.

[29214] Nucleotide sequences of host target binding sites, such as

BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2089 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[29215] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2090 (VGAM2090) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[29216] VGAM2090 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2090 was detected is described hereinabove with reference to Figs. 2-8.

[29217] VGAM2090 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Fowlpox virus.
VGAM2090 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[29218] VGAM2090 gene, herein designated VGAM GENE, encodes a VGAM2090 precursor RNA, herein designated VGAM

PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2090 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2090 precursor RNA is designated SEQ ID:2076, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2076 is located at position 110457 relative to the genome of Fowlpox virus.

[29219] VGAM2090 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2090 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[29220] An enzyme complex designated DICER COMPLEX, dices the VGAM2090 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2090 RNA, herein designated VGAM RNA, a single stranded ~22 nt

long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 49%) nucleotide sequence of VGAM2090 RNA is designated SEQ ID:4801, and is provided hereinbelow with reference to the sequence listing part.

[29221] VGAM2090 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2090 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2090 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[29222] VGAM2090 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2090 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2090 RNA, herein designated

VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2090 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2090 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[29223] The complementary binding of VGAM2090 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2090 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2090 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2090 host target protein, herein desig-

nated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[29224] It is appreciated that VGAM2090 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2090 host target genes. The mRNA of each one of this plurality of VGAM2090 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2090 RNA, herein designated VGAM RNA, and which when bound by VGAM2090 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2090 host target proteins.

[29225] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2090 gene, herein designated VGAM GENE, on one or more VGAM2090 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are

also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[29226] It is yet further appreciated that a function of VGAM2090 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2090 include diagnosis, prevention and treatment of viral infection by Fowlpox virus. Specific functions, and accordingly utilities, of VGAM2090 correlate with, and may be deduced from, the identity of the host target genes which VGAM2090 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[29227] Nucleotide sequences of the VGAM2090 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2090 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2090 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2090 are further described hereinbelow with reference to Table 1.

[29228] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2090 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[29229] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2091 (VGAM2091) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[29230] VGAM2091 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2091 was detected is described hereinabove with reference to Figs. 2-8.

[29231] VGAM2091 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Fowlpox virus.
VGAM2091 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[29232] VGAM2091 gene, herein designated VGAM GENE, encodes

a VGAM2091 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2091 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2091 precursor RNA is designated SEQ ID:2077, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2077 is located at position 108768 relative to the genome of Fowlpox virus.

[29233] VGAM2091 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2091 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[29234] An enzyme complex designated DICER COMPLEX, dices the VGAM2091 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2091 RNA,

herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 46%) nucleotide sequence of VGAM2091 RNA is designated SEQ ID:4802, and is provided hereinbelow with reference to the sequence listing part.

[29235] VGAM2091 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2091 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2091 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[29236] VGAM2091 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2091 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nu-

cleotide sequence of VGAM2091 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2091 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2091 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[29237] The complementary binding of VGAM2091 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2091 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2091 host target RNA, herein designated VGAM HOST TARGET

RNA, into VGAM2091 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[29238] It is appreciated that VGAM2091 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2091 host target genes. The mRNA of each one of this plurality of VGAM2091 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2091 RNA, herein designated VGAM RNA, and which when bound by VGAM2091 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2091 host target proteins.

[29239] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2091 gene, herein designated VGAM GENE, on one or more VGAM2091 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4

and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[29240] It is yet further appreciated that a function of VGAM2091 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2091 include diagnosis, prevention and treatment of viral infection by Fowlpox virus. Specific functions, and accordingly utilities, of VGAM2091 correlate with, and may be deduced from, the identity of the host target genes which VGAM2091 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[29241] Nucleotide sequences of the VGAM2091 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2091 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2091 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2091 are further

described hereinbelow with reference to Table 1.

[29242] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2091 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[29243] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2092 (VGAM2092) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[29244] VGAM2092 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2092 was detected is described hereinabove with reference to Figs. 2-8.

[29245] VGAM2092 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Fowlpox virus.
VGAM2092 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[29246] VGAM2092 gene, herein designated VGAM GENE, encodes a VGAM2092 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2092 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2092 precursor RNA is designated SEQ ID:2078, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2078 is located at position 102276 relative to the genome of Fowlpox virus.

[29247] VGAM2092 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2092 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[29248] An enzyme complex designated DICER COMPLEX, dices the VGAM2092 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, into VGAM2092 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 54%) nucleotide sequence of VGAM2092 RNA is designated SEQ ID:4803, and is provided hereinbelow with reference to the sequence listing part.

[29249] VGAM2092 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2092 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2092 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[29250] VGAM2092 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2092 host target RNA, herein designated VGAM HOST TARGET RNA. This

complementary binding is due to the fact that the nucleotide sequence of VGAM2092 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2092 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2092 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[29251] The complementary binding of VGAM2092 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2092 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2092

host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2092 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[29252] It is appreciated that VGAM2092 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2092 host target genes. The mRNA of each one of this plurality of VGAM2092 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2092 RNA, herein designated VGAM RNA, and which when bound by VGAM2092 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2092 host target proteins.

[29253] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2092 gene, herein designated VGAM GENE, on one or more VGAM2092 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated

only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[29254] It is yet further appreciated that a function of VGAM2092 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2092 include diagnosis, prevention and treatment of viral infection by Fowlpox virus. Specific functions, and accordingly utilities, of VGAM2092 correlate with, and may be deduced from, the identity of the host target genes which VGAM2092 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[29255] Nucleotide sequences of the VGAM2092 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2092 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2092 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, of VGAM2092 are further described hereinbelow with reference to Table 1.

[29256] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2092 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[29257] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2093 (VGAM2093) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[29258] VGAM2093 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2093 was detected is described hereinabove with reference to Figs. 2-8.

[29259] VGAM2093 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Camelpox virus. VGAM2093 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the

human genome.

[29260] VGAM2093 gene, herein designated VGAM GENE, encodes a VGAM2093 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2093 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2093 precursor RNA is designated SEQ ID:2079, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2079 is located at position 164255 relative to the genome of Camelpox virus.

[29261] VGAM2093 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2093 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[29262] An enzyme complex designated DICER COMPLEX, dices

the VGAM2093 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2093 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide sequence of VGAM2093 RNA is designated SEQ ID:4804, and is provided hereinbelow with reference to the sequence listing part.

[29263] VGAM2093 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2093 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2093 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[29264] VGAM2093 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2093 host target

RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2093 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2093 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2093 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[29265] The complementary binding of VGAM2093 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2093 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE

II and BINDING SITE III, inhibits translation of VGAM2093 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2093 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[29266] It is appreciated that VGAM2093 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2093 host target genes. The mRNA of each one of this plurality of VGAM2093 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2093 RNA, herein designated VGAM RNA, and which when bound by VGAM2093 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2093 host target proteins.

[29267] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2093 gene, herein designated VGAM GENE, on one or more VGAM2093 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a spe-

cific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[29268] It is yet further appreciated that a function of VGAM2093 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2093 include diagnosis, prevention and treatment of viral infection by Camelpox virus. Specific functions, and accordingly utilities, of VGAM2093 correlate with, and may be deduced from, the identity of the host target genes which VGAM2093 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[29269] Nucleotide sequences of the VGAM2093 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2093 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of

VGAM2093 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2093 are further described hereinbelow with reference to Table 1.

[29270] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2093 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[29271] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2094 (VGAM2094) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[29272] VGAM2094 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2094 was detected is described hereinabove with reference to Figs. 2-8.

[29273] VGAM2094 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Camelpox virus. VGAM2094 host target gene, herein designated VGAM

HOST TARGET GENE, is a human gene contained in the human genome.

[29274] VGAM2094 gene, herein designated VGAM GENE, encodes a VGAM2094 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2094 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2094 precursor RNA is designated SEQ ID:2080, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2080 is located at position 169679 relative to the genome of Camelpox virus.

[29275] VGAM2094 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2094 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[29276] An enzyme complex designated DICER COMPLEX, dices the VGAM2094 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2094 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of VGAM2094 RNA is designated SEQ ID:4805, and is provided hereinbelow with reference to the sequence listing part.

[29277] VGAM2094 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2094 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2094 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[29278] VGAM2094 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites

located in untranslated regions of VGAM2094 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2094 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2094 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2094 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[29279] The complementary binding of VGAM2094 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2094 host target RNA, herein designated VGAM

HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2094 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2094 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[29280] It is appreciated that VGAM2094 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2094 host target genes. The mRNA of each one of this plurality of VGAM2094 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2094 RNA, herein designated VGAM RNA, and which when bound by VGAM2094 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2094 host target proteins.

[29281] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2094 gene, herein designated VGAM GENE, on one or more VGAM2094 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove

with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[29282] It is yet further appreciated that a function of VGAM2094 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2094 include diagnosis, prevention and treatment of viral infection by Camelpox virus. Specific functions, and accordingly utilities, of VGAM2094 correlate with, and may be deduced from, the identity of the host target genes which VGAM2094 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[29283] Nucleotide sequences of the VGAM2094 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2094 RNA, herein designated VGAM RNA, and

a schematic representation of the secondary folding of VGAM2094 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2094 are further described hereinbelow with reference to Table 1.

[29284] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2094 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[29285] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2095 (VGAM2095) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[29286] VGAM2095 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2095 was detected is described hereinabove with reference to Figs. 2-8.

[29287] VGAM2095 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Camelpox virus.

VGAM2095 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[29288] VGAM2095 gene, herein designated VGAM GENE, encodes a VGAM2095 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2095 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2095 precursor RNA is designated SEQ ID:2081, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2081 is located at position 174432 relative to the genome of Camelpox virus.

[29289] VGAM2095 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2095 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of

the second half thereof.

[29290] An enzyme complex designated DICER COMPLEX, dices the VGAM2095 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2095 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM2095 RNA is designated SEQ ID:4806, and is provided hereinbelow with reference to the sequence listing part.

[29291] VGAM2095 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2095 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2095 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[29292] VGAM2095 RNA, herein designated VGAM RNA, binds

complementarily to one or more host target binding sites located in untranslated regions of VGAM2095 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2095 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2095 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2095 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[29293] The complementary binding of VGAM2095 RNA, herein designated VGAM RNA, to host target binding sites on

VGAM2095 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2095 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2095 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[29294] It is appreciated that VGAM2095 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2095 host target genes. The mRNA of each one of this plurality of VGAM2095 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2095 RNA, herein designated VGAM RNA, and which when bound by VGAM2095 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2095 host target proteins.

[29295] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2095 gene, herein designated VGAM GENE, on one or more VGAM2095 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other

known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[29296] It is yet further appreciated that a function of VGAM2095 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2095 include diagnosis, prevention and treatment of viral infection by Camelpox virus. Specific functions, and accordingly utilities, of VGAM2095 correlate with, and may be deduced from, the identity of the host target genes which VGAM2095 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[29297] Nucleotide sequences of the VGAM2095 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the

diced VGAM2095 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2095 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2095 are further described hereinbelow with reference to Table 1.

[29298] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2095 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[29299] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2096 (VGAM2096) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[29300] VGAM2096 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2096 was detected is described hereinabove with reference to Figs. 2-8.

[29301] VGAM2096 gene, herein designated VGAM GENE, is a viral

gene contained in the genome of Camelpox virus. VGAM2096 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[29302] VGAM2096 gene, herein designated VGAM GENE, encodes a VGAM2096 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2096 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2096 precursor RNA is designated SEQ ID:2082, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2082 is located at position 170764 relative to the genome of Camelpox virus.

[29303] VGAM2096 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2096 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial

inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[29304] An enzyme complex designated DICER COMPLEX, dices the VGAM2096 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2096 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 65%) nucleotide sequence of VGAM2096 RNA is designated SEQ ID:4807, and is provided hereinbelow with reference to the sequence listing part.

[29305] VGAM2096 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2096 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2096 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[29306] VGAM2096 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2096 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2096 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2096 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2096 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[29307] The complementary binding of VGAM2096 RNA, herein

designated VGAM RNA, to host target binding sites on VGAM2096 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2096 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2096 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[29308] It is appreciated that VGAM2096 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2096 host target genes. The mRNA of each one of this plurality of VGAM2096 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2096 RNA, herein designated VGAM RNA, and which when bound by VGAM2096 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2096 host target proteins.

[29309] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2096 gene, herein designated VGAM GENE, on one or more VGAM2096 host target gene, herein designated

VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[29310] It is yet further appreciated that a function of VGAM2096 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2096 include diagnosis, prevention and treatment of viral infection by Camelpox virus. Specific functions, and accordingly utilities, of VGAM2096 correlate with, and may be deduced from, the identity of the host target genes which VGAM2096 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[29311] Nucleotide sequences of the VGAM2096 precursor RNA,

herein designated VGAM PRECURSOR RNA, and of the diced VGAM2096 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2096 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2096 are further described hereinbelow with reference to Table 1.

[29312] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2096 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[29313] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2097 (VGAM2097) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[29314] VGAM2097 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2097 was detected is described hereinabove with reference to Figs. 2-8.

[29315] VGAM2097 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Camelpox virus. VGAM2097 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[29316] VGAM2097 gene, herein designated VGAM GENE, encodes a VGAM2097 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2097 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2097 precursor RNA is designated SEQ ID:2083, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2083 is located at position 176879 relative to the genome of Camelpox virus.

[29317] VGAM2097 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2097 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the

RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[29318] An enzyme complex designated DICER COMPLEX, dices the VGAM2097 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2097 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 68%) nucleotide sequence of VGAM2097 RNA is designated SEQ ID:4808, and is provided hereinbelow with reference to the sequence listing part.

[29319] VGAM2097 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2097 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2097 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN COD-

ING and 3UTR respectively.

[29320] VGAM2097 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2097 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2097 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2097 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2097 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[29321] The complementary binding of VGAM2097 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2097 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2097 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2097 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[29322] It is appreciated that VGAM2097 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2097 host target genes. The mRNA of each one of this plurality of VGAM2097 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2097 RNA, herein designated VGAM RNA, and which when bound by VGAM2097 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2097 host target proteins.

[29323] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2097 gene, herein designated VGAM GENE, on one

or more VGAM2097 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[29324] It is yet further appreciated that a function of VGAM2097 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2097 include diagnosis, prevention and treatment of viral infection by Camelpox virus. Specific functions, and accordingly utilities, of VGAM2097 correlate with, and may be deduced from, the identity of the host target genes which VGAM2097 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[29325] Nucleotide sequences of the VGAM2097 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2097 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2097 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2097 are further described hereinbelow with reference to Table 1.

[29326] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2097 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[29327] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2098 (VGAM2098) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[29328] VGAM2098 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2098 was detected is de-

scribed hereinabove with reference to Figs. 2-8.

[29329] VGAM2098 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Camelpox virus. VGAM2098 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[29330] VGAM2098 gene, herein designated VGAM GENE, encodes a VGAM2098 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2098 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2098 precursor RNA is designated SEQ ID:2084, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2084 is located at position 174573 relative to the genome of Camelpox virus.

[29331] VGAM2098 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2098 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the

fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[29332] An enzyme complex designated DICER COMPLEX, dices the VGAM2098 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2098 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM2098 RNA is designated SEQ ID:4809, and is provided hereinbelow with reference to the sequence listing part.

[29333] VGAM2098 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2098 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2098 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and

a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[29334] VGAM2098 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2098 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2098 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2098 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2098 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both

3UTR and 5UTR regions.

[29335] The complementary binding of VGAM2098 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2098 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2098 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2098 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[29336] It is appreciated that VGAM2098 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2098 host target genes. The mRNA of each one of this plurality of VGAM2098 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2098 RNA, herein designated VGAM RNA, and which when bound by VGAM2098 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2098 host target proteins.

[29337] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by

VGAM2098 gene, herein designated VGAM GENE, on one or more VGAM2098 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[29338] It is yet further appreciated that a function of VGAM2098 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2098 include diagnosis, prevention and treatment of viral infection by Camelpox virus. Specific functions, and accordingly utilities, of VGAM2098 correlate with, and may be deduced from, the identity of the host target genes which VGAM2098 binds and inhibits, and the function of these host target genes, as elaborated

hereinbelow.

[29339] Nucleotide sequences of the VGAM2098 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2098 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2098 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2098 are further described hereinbelow with reference to Table 1.

[29340] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2098 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[29341] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2099 (VGAM2099) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[29342] VGAM2099 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene.

The method by which VGAM2099 was detected is described hereinabove with reference to Figs. 2-8.

[29343] VGAM2099 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Camelpox virus. VGAM2099 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[29344] VGAM2099 gene, herein designated VGAM GENE, encodes a VGAM2099 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2099 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2099 precursor RNA is designated SEQ ID:2085, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2085 is located at position 174840 relative to the genome of Camelpox virus.

[29345] VGAM2099 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2099 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typi-

cal of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[29346] An enzyme complex designated DICER COMPLEX, dices the VGAM2099 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2099 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM2099 RNA is designated SEQ ID:4810, and is provided hereinbelow with reference to the sequence listing part.

[29347] VGAM2099 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2099 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2099 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding

gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[29348] VGAM2099 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2099 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2099 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2099 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2099 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be lo-

cated in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[29349] The complementary binding of VGAM2099 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2099 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2099 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2099 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[29350] It is appreciated that VGAM2099 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2099 host target genes. The mRNA of each one of this plurality of VGAM2099 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2099 RNA, herein designated VGAM RNA, and which when bound by VGAM2099 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2099 host target proteins.

[29351] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with

specific reference to translational inhibition exerted by VGAM2099 gene, herein designated VGAM GENE, on one or more VGAM2099 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[29352] It is yet further appreciated that a function of VGAM2099 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2099 include diagnosis, prevention and treatment of viral infection by Camelpox virus. Specific functions, and accordingly utilities, of VGAM2099 correlate with, and may be deduced from, the identity of the host target genes which VGAM2099 binds and inhibits,

and the function of these host target genes, as elaborated hereinbelow.

[29353] Nucleotide sequences of the VGAM2099 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2099 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2099 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2099 are further described hereinbelow with reference to Table 1.

[29354] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2099 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[29355] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2100 (VGAM2100) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[29356] VGAM2100 is a novel bioinformatically detected regula-

tory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2100 was detected is described hereinabove with reference to Figs. 2-8.

[29357] VGAM2100 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Camelpox virus. VGAM2100 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[29358] VGAM2100 gene, herein designated VGAM GENE, encodes a VGAM2100 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2100 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2100 precursor RNA is designated SEQ ID:2086, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2086 is located at position 176689 relative to the genome of Camelpox virus.

[29359] VGAM2100 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2100 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure.

As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[29360] An enzyme complex designated DICER COMPLEX, dices the VGAM2100 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2100 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM2100 RNA is designated SEQ ID:4811, and is provided hereinbelow with reference to the sequence listing part.

[29361] VGAM2100 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2100 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2100 host target RNA, herein designated VGAM HOST TARGET RNA, comprises

three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[29362] VGAM2100 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2100 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2100 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2100 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2100 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an

example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[29363] The complementary binding of VGAM2100 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2100 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2100 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2100 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[29364] It is appreciated that VGAM2100 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2100 host target genes. The mRNA of each one of this plurality of VGAM2100 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2100 RNA, herein designated VGAM RNA, and which when bound by VGAM2100 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2100 host target proteins.

[29365] It is further appreciated by one skilled in the art that the

mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2100 gene, herein designated VGAM GENE, on one or more VGAM2100 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[29366] It is yet further appreciated that a function of VGAM2100 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2100 include diagnosis, prevention and treatment of viral infection by Camelpox virus. Specific functions, and accordingly utilities, of VGAM2100 correlate with, and may be deduced from, the identity of the

host target genes which VGAM2100 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[29367] Nucleotide sequences of the VGAM2100 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2100 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2100 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2100 are further described hereinbelow with reference to Table 1.

[29368] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2100 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[29369] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2101 (VGAM2101) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[29370] VGAM2101 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2101 was detected is described hereinabove with reference to Figs. 2-8.

[29371] VGAM2101 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Camelpox virus. VGAM2101 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[29372] VGAM2101 gene, herein designated VGAM GENE, encodes a VGAM2101 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2101 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2101 precursor RNA is designated SEQ ID:2087, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2087 is located at position 171927 relative to the genome of Camelpox virus.

[29373] VGAM2101 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2101 folded precursor RNA, herein designated VGAM FOLDED PRECUR-

SOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[29374] An enzyme complex designated DICER COMPLEX, dices the VGAM2101 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2101 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM2101 RNA is designated SEQ ID:4812, and is provided hereinbelow with reference to the sequence listing part.

[29375] VGAM2101 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2101 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2101 host target RNA,

herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[29376] VGAM2101 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2101 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2101 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2101 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2101 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host tar-

get binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[29377] The complementary binding of VGAM2101 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2101 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2101 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2101 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[29378] It is appreciated that VGAM2101 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2101 host target genes. The mRNA of each one of this plurality of VGAM2101 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2101 RNA, herein designated VGAM RNA, and which when bound by VGAM2101 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2101 host target proteins.

[29379] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2101 gene, herein designated VGAM GENE, on one or more VGAM2101 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[29380] It is yet further appreciated that a function of VGAM2101 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2101 include diagnosis, prevention and treatment of viral infection by Camelpox virus. Specific functions, and accordingly utilities, of VGAM2101 corre-

late with, and may be deduced from, the identity of the host target genes which VGAM2101 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[29381] Nucleotide sequences of the VGAM2101 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2101 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2101 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2101 are further described hereinbelow with reference to Table 1.

[29382] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2101 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[29383] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2102 (VGAM2102) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the

art.

[29384] VGAM2102 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2102 was detected is described hereinabove with reference to Figs. 2-8.

[29385] VGAM2102 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Camelpox virus. VGAM2102 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[29386] VGAM2102 gene, herein designated VGAM GENE, encodes a VGAM2102 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2102 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2102 precursor RNA is designated SEQ ID:2088, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2088 is located at position 168981 relative to the genome of Camelpox virus.

[29387] VGAM2102 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2102 folded

precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[29388] An enzyme complex designated DICER COMPLEX, dices the VGAM2102 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2102 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 53%) nucleotide sequence of VGAM2102 RNA is designated SEQ ID:4813, and is provided hereinbelow with reference to the sequence listing part.

[29389] VGAM2102 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2102 host target RNA, herein designated

VGAM HOST TARGET RNA. VGAM2102 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[29390] VGAM2102 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2102 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2102 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2102 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2102 host target RNA, herein designated VGAM HOST TARGET RNA.

It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[29391] The complementary binding of VGAM2102 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2102 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2102 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2102 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[29392] It is appreciated that VGAM2102 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2102 host target genes. The mRNA of each one of this plurality of VGAM2102 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2102 RNA, herein designated VGAM RNA, and which when bound by VGAM2102 RNA, herein designated VGAM RNA, causes inhibition of translation of

respective one or more VGAM2102 host target proteins.

[29393] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2102 gene, herein designated VGAM GENE, on one or more VGAM2102 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[29394] It is yet further appreciated that a function of VGAM2102 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2102 include diagnosis, prevention and treatment of viral infection by Camelpox virus. Specific

functions, and accordingly utilities, of VGAM2102 correlate with, and may be deduced from, the identity of the host target genes which VGAM2102 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[29395] Nucleotide sequences of the VGAM2102 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2102 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2102 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2102 are further described hereinbelow with reference to Table 1.

[29396] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2102 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[29397] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2103 (VGAM2103) viral gene, which modulates expression of respective host target genes thereof, the func-

tion and utility of which host target genes is known in the art.

[29398] VGAM2103 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2103 was detected is described hereinabove with reference to Figs. 2-8.

[29399] VGAM2103 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Camelpox virus. VGAM2103 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[29400] VGAM2103 gene, herein designated VGAM GENE, encodes a VGAM2103 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2103 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2103 precursor RNA is designated SEQ ID:2089, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2089 is located at position 177859 relative to the genome of Camelpox virus.

[29401] VGAM2103 precursor RNA, herein designated VGAM PRE-

CURSOR RNA, folds onto itself, forming VGAM2103 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[29402] An enzyme complex designated DICER COMPLEX, dices the VGAM2103 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2103 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide sequence of VGAM2103 RNA is designated SEQ ID:4814, and is provided hereinbelow with reference to the sequence listing part.

[29403] VGAM2103 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger

RNA, VGAM2103 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2103 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[29404] VGAM2103 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2103 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2103 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2103 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2103 host

target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[29405] The complementary binding of VGAM2103 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2103 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2103 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2103 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[29406] It is appreciated that VGAM2103 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2103 host target genes. The mRNA of each one of this plurality of VGAM2103 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2103 RNA, herein designated VGAM RNA, and which when bound by VGAM2103 RNA, herein

designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2103 host target proteins.

[29407] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2103 gene, herein designated VGAM GENE, on one or more VGAM2103 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[29408] It is yet further appreciated that a function of VGAM2103 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2103 include diagnosis, prevention and

treatment of viral infection by Camelpox virus. Specific functions, and accordingly utilities, of VGAM2103 correlate with, and may be deduced from, the identity of the host target genes which VGAM2103 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[29409] Nucleotide sequences of the VGAM2103 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2103 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2103 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2103 are further described hereinbelow with reference to Table 1.

[29410] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2103 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[29411] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2104 (VGAM2104) viral gene, which modulates ex-

pression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[29412] VGAM2104 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2104 was detected is described hereinabove with reference to Figs. 2-8.

[29413] VGAM2104 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Camelpox virus. VGAM2104 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[29414] VGAM2104 gene, herein designated VGAM GENE, encodes a VGAM2104 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2104 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2104 precursor RNA is designated SEQ ID:2090, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2090 is located at position 161818 relative to the genome of Camelpox virus.

[29415] VGAM2104 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2104 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[29416] An enzyme complex designated DICER COMPLEX, dices the VGAM2104 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2104 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 45%) nucleotide sequence of VGAM2104 RNA is designated SEQ ID:4815, and is provided hereinbelow with reference to the sequence listing part.

[29417] VGAM2104 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2104 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2104 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[29418] VGAM2104 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2104 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2104 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2104 RNA, herein designated VGAM RNA, may have a different number of host target

binding sites in untranslated regions of a VGAM2104 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[29419] The complementary binding of VGAM2104 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2104 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2104 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2104 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[29420] It is appreciated that VGAM2104 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2104 host target genes. The mRNA of each one of this plurality of VGAM2104 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2104 RNA, herein designated VGAM

RNA, and which when bound by VGAM2104 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2104 host target proteins.

[29421] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2104 gene, herein designated VGAM GENE, on one or more VGAM2104 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[29422] It is yet further appreciated that a function of VGAM2104 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly,

utilities of VGAM2104 include diagnosis, prevention and treatment of viral infection by Camelpox virus. Specific functions, and accordingly utilities, of VGAM2104 correlate with, and may be deduced from, the identity of the host target genes which VGAM2104 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[29423] Nucleotide sequences of the VGAM2104 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2104 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2104 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2104 are further described hereinbelow with reference to Table 1.

[29424] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2104 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[29425] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Mes-

senger 2105 (VGAM2105) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[29426] VGAM2105 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2105 was detected is described hereinabove with reference to Figs. 2-8.

[29427] VGAM2105 gene, herein designated VGAM GENE, is a viral gene contained in the genome of grapevine chrome mosaic virus. VGAM2105 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[29428] VGAM2105 gene, herein designated VGAM GENE, encodes a VGAM2105 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2105 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2105 precursor RNA is designated SEQ ID:2091, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2091 is located at position 3783

relative to the genome of grapevine chrome mosaic virus.

[29429] VGAM2105 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2105 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[29430] An enzyme complex designated DICER COMPLEX, dices the VGAM2105 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2105 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of VGAM2105 RNA is designated SEQ ID:4816, and is provided hereinbelow with reference to the sequence listing part.

[29431] VGAM2105 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2105 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2105 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[29432] VGAM2105 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2105 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2105 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2105 RNA, herein designated

VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2105 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[29433] The complementary binding of VGAM2105 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2105 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2105 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2105 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[29434] It is appreciated that VGAM2105 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2105 host target genes. The mRNA of each one of this plurality of VGAM2105 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly com-

plementary to VGAM2105 RNA, herein designated VGAM RNA, and which when bound by VGAM2105 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2105 host target proteins.

[29435] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2105 gene, herein designated VGAM GENE, on one or more VGAM2105 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[29436] It is yet further appreciated that a function of VGAM2105 is inhibition of expression of host target genes, as part of

a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2105 include diagnosis, prevention and treatment of viral infection by grapevine chrome mosaic virus. Specific functions, and accordingly utilities, of VGAM2105 correlate with, and may be deduced from, the identity of the host target genes which VGAM2105 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[29437] Nucleotide sequences of the VGAM2105 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2105 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2105 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2105 are further described hereinbelow with reference to Table 1.

[29438] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2105 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[29439] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present

invention, referred to here as Viral Genomic Address Messenger 2106 (VGAM2106) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[29440] VGAM2106 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2106 was detected is described hereinabove with reference to Figs. 2-8.

[29441] VGAM2106 gene, herein designated VGAM GENE, is a viral gene contained in the genome of grapevine chrome mosaic virus. VGAM2106 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[29442] VGAM2106 gene, herein designated VGAM GENE, encodes a VGAM2106 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2106 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2106 precursor RNA is designated SEQ ID:2092, and is provided hereinbelow with reference to the sequence listing part. Nu-

cleotide sequence SEQ ID:2092 is located at position 4094 relative to the genome of grapevine chrome mosaic virus.

[29443] VGAM2106 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2106 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[29444] An enzyme complex designated DICER COMPLEX, dices the VGAM2106 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2106 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 59%) nucleotide sequence of VGAM2106 RNA is designated SEQ ID:4817, and is provided hereinbelow with reference to the sequence

listing part.

[29445] VGAM2106 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2106 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2106 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[29446] VGAM2106 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2106 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2106 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not

meant to be limiting VGAM2106 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2106 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[29447] The complementary binding of VGAM2106 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2106 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2106 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2106 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[29448] It is appreciated that VGAM2106 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2106 host target genes. The mRNA of each one of this plurality of VGAM2106 host target genes comprises one or more host target binding sites, each

having a nucleotide sequence which is at least partly complementary to VGAM2106 RNA, herein designated VGAM RNA, and which when bound by VGAM2106 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2106 host target proteins.

[29449] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2106 gene, herein designated VGAM GENE, on one or more VGAM2106 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[29450] It is yet further appreciated that a function of VGAM2106

is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2106 include diagnosis, prevention and treatment of viral infection by grapevine chrome mosaic virus. Specific functions, and accordingly utilities, of VGAM2106 correlate with, and may be deduced from, the identity of the host target genes which VGAM2106 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[29451] Nucleotide sequences of the VGAM2106 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2106 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2106 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2106 are further described hereinbelow with reference to Table 1.

[29452] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2106 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[29453] Fig. 1 further provides a conceptual description of another

novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2107 (VGAM2107) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[29454] VGAM2107 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2107 was detected is described hereinabove with reference to Figs. 2-8.

[29455] VGAM2107 gene, herein designated VGAM GENE, is a viral gene contained in the genome of grapevine chrome mosaic virus. VGAM2107 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[29456] VGAM2107 gene, herein designated VGAM GENE, encodes a VGAM2107 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2107 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2107 precursor RNA is designated SEQ ID:2093, and is provided here-

inbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2093 is located at position 2929 relative to the genome of grapevine chrome mosaic virus.

[29457] VGAM2107 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2107 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[29458] An enzyme complex designated DICER COMPLEX, dices the VGAM2107 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2107 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 46%) nucleotide sequence of VGAM2107 RNA is designated SEQ ID:4818, and

is provided hereinbelow with reference to the sequence listing part.

[29459] VGAM2107 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2107 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2107 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[29460] VGAM2107 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2107 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2107 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites

shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2107 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2107 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[29461] The complementary binding of VGAM2107 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2107 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2107 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2107 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[29462] It is appreciated that VGAM2107 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2107 host target genes. The mRNA of each one of this plurality of VGAM2107 host target genes

comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2107 RNA, herein designated VGAM RNA, and which when bound by VGAM2107 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2107 host target proteins.

[29463] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2107 gene, herein designated VGAM GENE, on one or more VGAM2107 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[29464] It is yet further appreciated that a function of VGAM2107 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2107 include diagnosis, prevention and treatment of viral infection by grapevine chrome mosaic virus. Specific functions, and accordingly utilities, of VGAM2107 correlate with, and may be deduced from, the identity of the host target genes which VGAM2107 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[29465] Nucleotide sequences of the VGAM2107 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2107 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2107 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2107 are further described hereinbelow with reference to Table 1.

[29466] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2107 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[29467] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2108 (VGAM2108) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[29468] VGAM2108 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2108 was detected is described hereinabove with reference to Figs. 2-8.

[29469] VGAM2108 gene, herein designated VGAM GENE, is a viral gene contained in the genome of grapevine chrome mosaic virus. VGAM2108 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[29470] VGAM2108 gene, herein designated VGAM GENE, encodes a VGAM2108 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2108 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2108 precur-

sor RNA is designated SEQ ID:2094, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2094 is located at position 3193 relative to the genome of grapevine chrome mosaic virus.

[29471] VGAM2108 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2108 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[29472] An enzyme complex designated DICER COMPLEX, dices the VGAM2108 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2108 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 51%) nucleotide se-

quence of VGAM2108 RNA is designated SEQ ID:4819, and is provided hereinbelow with reference to the sequence listing part.

[29473] VGAM2108 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2108 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2108 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[29474] VGAM2108 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2108 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2108 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is ap-

preciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2108 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2108 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[29475] The complementary binding of VGAM2108 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2108 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2108 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2108 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[29476] It is appreciated that VGAM2108 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2108 host target genes. The mRNA of

each one of this plurality of VGAM2108 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2108 RNA, herein designated VGAM RNA, and which when bound by VGAM2108 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2108 host target proteins.

[29477] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2108 gene, herein designated VGAM GENE, on one or more VGAM2108 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science

294,779 (2001)).

[29478] It is yet further appreciated that a function of VGAM2108 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2108 include diagnosis, prevention and treatment of viral infection by grapevine chrome mosaic virus. Specific functions, and accordingly utilities, of VGAM2108 correlate with, and may be deduced from, the identity of the host target genes which VGAM2108 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[29479] Nucleotide sequences of the VGAM2108 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2108 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2108 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2108 are further described hereinbelow with reference to Table 1.

[29480] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2108 RNA, herein designated VGAM RNA, are de-

scribed hereinbelow with reference to Table 2.

[29481] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2109 (VGAM2109) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[29482] VGAM2109 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2109 was detected is described hereinabove with reference to Figs. 2-8.

[29483] VGAM2109 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Goatpox virus. VGAM2109 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[29484] VGAM2109 gene, herein designated VGAM GENE, encodes a VGAM2109 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2109 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly

similar to the nucleotide sequence of VGAM2109 precursor RNA is designated SEQ ID:2095, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2095 is located at position 22662 relative to the genome of Goatpox virus.

[29485] VGAM2109 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2109 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[29486] An enzyme complex designated DICER COMPLEX, dices the VGAM2109 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2109 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other

necessary proteins. A probable (over 71%) nucleotide sequence of VGAM2109 RNA is designated SEQ ID:4820, and is provided hereinbelow with reference to the sequence listing part.

[29487] VGAM2109 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2109 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2109 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[29488] VGAM2109 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2109 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2109 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I,

BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2109 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2109 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[29489] The complementary binding of VGAM2109 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2109 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2109 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2109 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[29490] It is appreciated that VGAM2109 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents

a plurality of VGAM2109 host target genes. The mRNA of each one of this plurality of VGAM2109 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2109 RNA, herein designated VGAM RNA, and which when bound by VGAM2109 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2109 host target proteins.

[29491] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2109 gene, herein designated VGAM GENE, on one or more VGAM2109 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[29492] It is yet further appreciated that a function of VGAM2109 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2109 include diagnosis, prevention and treatment of viral infection by Goatpox virus. Specific functions, and accordingly utilities, of VGAM2109 correlate with, and may be deduced from, the identity of the host target genes which VGAM2109 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[29493] Nucleotide sequences of the VGAM2109 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2109 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2109 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2109 are further described hereinbelow with reference to Table 1.

[29494] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites

to VGAM2109 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[29495] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2110 (VGAM2110) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[29496] VGAM2110 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2110 was detected is described hereinabove with reference to Figs. 2-8.

[29497] VGAM2110 gene, herein designated VGAM GENE, is a viral gene contained in the genome of grapevine chrome mosaic virus. VGAM2110 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[29498] VGAM2110 gene, herein designated VGAM GENE, encodes a VGAM2110 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2110 precursor RNA, herein designated VGAM PRECURSOR RNA, does not en-

code a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2110 precursor RNA is designated SEQ ID:2096, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2096 is located at position 1090 relative to the genome of grapevine chrome mosaic virus.

[29499] VGAM2110 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2110 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[29500] An enzyme complex designated DICER COMPLEX, dices the VGAM2110 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2110 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer together with other necessary proteins. A probable (over 44%) nucleotide sequence of VGAM2110 RNA is designated SEQ ID:4821, and is provided hereinbelow with reference to the sequence listing part.

[29501] VGAM2110 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2110 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2110 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[29502] VGAM2110 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2110 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2110 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3

such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2110 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2110 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[29503] The complementary binding of VGAM2110 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2110 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2110 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2110 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[29504] It is appreciated that VGAM2110 host target gene, herein

designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2110 host target genes. The mRNA of each one of this plurality of VGAM2110 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2110 RNA, herein designated VGAM RNA, and which when bound by VGAM2110 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2110 host target proteins.

[29505] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2110 gene, herein designated VGAM GENE, on one or more VGAM2110 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these

other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[29506] It is yet further appreciated that a function of VGAM2110 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2110 include diagnosis, prevention and treatment of viral infection by grapevine chrome mosaic virus. Specific functions, and accordingly utilities, of VGAM2110 correlate with, and may be deduced from, the identity of the host target genes which VGAM2110 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[29507] Nucleotide sequences of the VGAM2110 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2110 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2110 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2110 are further described hereinbelow with reference to Table 1.

[29508] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the

complementarity of each of these host target binding sites to VGAM2110 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[29509] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2111 (VGAM2111) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[29510] VGAM2111 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2111 was detected is described hereinabove with reference to Figs. 2-8.

[29511] VGAM2111 gene, herein designated VGAM GENE, is a viral gene contained in the genome of sheeppox virus. VGAM2111 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[29512] VGAM2111 gene, herein designated VGAM GENE, encodes a VGAM2111 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2111 precursor RNA,

herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2111 precursor RNA is designated SEQ ID:2097, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2097 is located at position 6922 relative to the genome of sheeppox virus.

[29513] VGAM2111 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2111 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[29514] An enzyme complex designated DICER COMPLEX, dices the VGAM2111 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2111 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short

~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM2111 RNA is designated SEQ ID:4822, and is provided hereinbelow with reference to the sequence listing part.

[29515] VGAM2111 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2111 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2111 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[29516] VGAM2111 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2111 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2111 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host

target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2111 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2111 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[29517] The complementary binding of VGAM2111 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2111 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2111 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2111 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[29518] It is appreciated that VGAM2111 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2111 host target genes. The mRNA of each one of this plurality of VGAM2111 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2111 RNA, herein designated VGAM RNA, and which when bound by VGAM2111 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2111 host target proteins.

[29519] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2111 gene, herein designated VGAM GENE, on one or more VGAM2111 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, al-

though specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[29520] It is yet further appreciated that a function of VGAM2111 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2111 include diagnosis, prevention and treatment of viral infection by sheeppox virus. Specific functions, and accordingly utilities, of VGAM2111 correlate with, and may be deduced from, the identity of the host target genes which VGAM2111 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[29521] Nucleotide sequences of the VGAM2111 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2111 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2111 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2111 are further described hereinbelow with reference to Table 1.

[29522] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of

Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2111 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[29523] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2112 (VGAM2112) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[29524] VGAM2112 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2112 was detected is described hereinabove with reference to Figs. 2-8.

[29525] VGAM2112 gene, herein designated VGAM GENE, is a viral gene contained in the genome of grapevine chrome mosaic virus. VGAM2112 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[29526] VGAM2112 gene, herein designated VGAM GENE, encodes a VGAM2112 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and un-

like most ordinary genes, VGAM2112 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2112 precursor RNA is designated SEQ ID:2098, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2098 is located at position 1230 relative to the genome of grapevine chrome mosaic virus.

[29527] VGAM2112 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2112 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[29528] An enzyme complex designated DICER COMPLEX, dices the VGAM2112 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2112 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a

hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of VGAM2112 RNA is designated SEQ ID:4823, and is provided hereinbelow with reference to the sequence listing part.

[29529] VGAM2112 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2112 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2112 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[29530] VGAM2112 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2112 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2112 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed

sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2112 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2112 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[29531] The complementary binding of VGAM2112 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2112 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2112 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2112 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target

protein is therefore outlined by a broken line.

[29532] It is appreciated that VGAM2112 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2112 host target genes. The mRNA of each one of this plurality of VGAM2112 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2112 RNA, herein designated VGAM RNA, and which when bound by VGAM2112 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2112 host target proteins.

[29533] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2112 gene, herein designated VGAM GENE, on one or more VGAM2112 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate ex-

pression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[29534] It is yet further appreciated that a function of VGAM2112 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2112 include diagnosis, prevention and treatment of viral infection by grapevine chrome mosaic virus. Specific functions, and accordingly utilities, of VGAM2112 correlate with, and may be deduced from, the identity of the host target genes which VGAM2112 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[29535] Nucleotide sequences of the VGAM2112 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2112 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2112 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2112 are further described hereinbelow with reference to Table 1.

[29536] Nucleotide sequences of host target binding sites, such as

BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2112 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[29537] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2113 (VGAM2113) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[29538] VGAM2113 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2113 was detected is described hereinabove with reference to Figs. 2-8.

[29539] VGAM2113 gene, herein designated VGAM GENE, is a viral gene contained in the genome of sheeppox virus. VGAM2113 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[29540] VGAM2113 gene, herein designated VGAM GENE, encodes a VGAM2113 precursor RNA, herein designated VGAM

PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2113 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2113 precursor RNA is designated SEQ ID:2099, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2099 is located at position 7750 relative to the genome of sheeppox virus.

[29541] VGAM2113 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2113 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[29542] An enzyme complex designated DICER COMPLEX, dices the VGAM2113 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2113 RNA, herein designated VGAM RNA, a single stranded ~22 nt

long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide sequence of VGAM2113 RNA is designated SEQ ID:4824, and is provided hereinbelow with reference to the sequence listing part.

[29543] VGAM2113 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2113 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2113 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[29544] VGAM2113 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2113 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2113 RNA, herein designated

VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2113 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2113 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[29545] The complementary binding of VGAM2113 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2113 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2113 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2113 host target protein, herein desig-

nated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[29546] It is appreciated that VGAM2113 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2113 host target genes. The mRNA of each one of this plurality of VGAM2113 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2113 RNA, herein designated VGAM RNA, and which when bound by VGAM2113 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2113 host target proteins.

[29547] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2113 gene, herein designated VGAM GENE, on one or more VGAM2113 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are

also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[29548] It is yet further appreciated that a function of VGAM2113 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2113 include diagnosis, prevention and treatment of viral infection by sheeppox virus. Specific functions, and accordingly utilities, of VGAM2113 correlate with, and may be deduced from, the identity of the host target genes which VGAM2113 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[29549] Nucleotide sequences of the VGAM2113 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2113 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2113 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2113 are further described hereinbelow with reference to Table 1.

[29550] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2113 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[29551] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2114 (VGAM2114) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[29552] VGAM2114 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2114 was detected is described hereinabove with reference to Figs. 2-8.

[29553] VGAM2114 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cowpox virus.
VGAM2114 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[29554] VGAM2114 gene, herein designated VGAM GENE, encodes

a VGAM2114 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2114 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2114 precursor RNA is designated SEQ ID:2100, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2100 is located at position 9163 relative to the genome of Cowpox virus.

[29555] VGAM2114 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2114 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[29556] An enzyme complex designated DICER COMPLEX, dices the VGAM2114 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2114 RNA,

herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 50%) nucleotide sequence of VGAM2114 RNA is designated SEQ ID:4825, and is provided hereinbelow with reference to the sequence listing part.

[29557] VGAM2114 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2114 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2114 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[29558] VGAM2114 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2114 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nu-

cleotide sequence of VGAM2114 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2114 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2114 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[29559] The complementary binding of VGAM2114 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2114 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2114 host target RNA, herein designated VGAM HOST TARGET

RNA, into VGAM2114 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[29560] It is appreciated that VGAM2114 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2114 host target genes. The mRNA of each one of this plurality of VGAM2114 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2114 RNA, herein designated VGAM RNA, and which when bound by VGAM2114 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2114 host target proteins.

[29561] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2114 gene, herein designated VGAM GENE, on one or more VGAM2114 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4

and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[29562] It is yet further appreciated that a function of VGAM2114 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2114 include diagnosis, prevention and treatment of viral infection by Cowpox virus. Specific functions, and accordingly utilities, of VGAM2114 correlate with, and may be deduced from, the identity of the host target genes which VGAM2114 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[29563] Nucleotide sequences of the VGAM2114 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2114 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2114 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2114 are further

described hereinbelow with reference to Table 1.

[29564] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2114 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[29565] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2115 (VGAM2115) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[29566] VGAM2115 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2115 was detected is described hereinabove with reference to Figs. 2-8.

[29567] VGAM2115 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cowpox virus.
VGAM2115 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[29568] VGAM2115 gene, herein designated VGAM GENE, encodes a VGAM2115 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2115 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2115 precursor RNA is designated SEQ ID:2101, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2101 is located at position 211598 relative to the genome of Cowpox virus.

[29569] VGAM2115 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2115 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[29570] An enzyme complex designated DICER COMPLEX, dices the VGAM2115 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2115 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide sequence of VGAM2115 RNA is designated SEQ ID:4826, and is provided hereinbelow with reference to the sequence listing part.

[29571] VGAM2115 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2115 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2115 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[29572] VGAM2115 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites

located in untranslated regions of VGAM2115 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2115 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2115 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2115 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[29573] The complementary binding of VGAM2115 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2115 host target RNA, herein designated VGAM

HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2115 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2115 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[29574] It is appreciated that VGAM2115 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2115 host target genes. The mRNA of each one of this plurality of VGAM2115 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2115 RNA, herein designated VGAM RNA, and which when bound by VGAM2115 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2115 host target proteins.

[29575] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2115 gene, herein designated VGAM GENE, on one or more VGAM2115 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove

with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[29576] It is yet further appreciated that a function of VGAM2115 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2115 include diagnosis, prevention and treatment of viral infection by Cowpox virus. Specific functions, and accordingly utilities, of VGAM2115 correlate with, and may be deduced from, the identity of the host target genes which VGAM2115 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[29577] Nucleotide sequences of the VGAM2115 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2115 RNA, herein designated VGAM RNA, and

a schematic representation of the secondary folding of VGAM2115 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2115 are further described hereinbelow with reference to Table 1.

[29578] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2115 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[29579] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2116 (VGAM2116) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[29580] VGAM2116 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2116 was detected is described hereinabove with reference to Figs. 2-8.

[29581] VGAM2116 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cowpox virus.

VGAM2116 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[29582] VGAM2116 gene, herein designated VGAM GENE, encodes a VGAM2116 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2116 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2116 precursor RNA is designated SEQ ID:2102, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2102 is located at position 208834 relative to the genome of Cowpox virus.

[29583] VGAM2116 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2116 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of

the second half thereof.

[29584] An enzyme complex designated DICER COMPLEX, dices the VGAM2116 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2116 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 52%) nucleotide sequence of VGAM2116 RNA is designated SEQ ID:4827, and is provided hereinbelow with reference to the sequence listing part.

[29585] VGAM2116 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2116 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2116 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[29586] VGAM2116 RNA, herein designated VGAM RNA, binds

complementarily to one or more host target binding sites located in untranslated regions of VGAM2116 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2116 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2116 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2116 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[29587] The complementary binding of VGAM2116 RNA, herein designated VGAM RNA, to host target binding sites on

VGAM2116 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2116 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2116 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[29588] It is appreciated that VGAM2116 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2116 host target genes. The mRNA of each one of this plurality of VGAM2116 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2116 RNA, herein designated VGAM RNA, and which when bound by VGAM2116 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2116 host target proteins.

[29589] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2116 gene, herein designated VGAM GENE, on one or more VGAM2116 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other

known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[29590] It is yet further appreciated that a function of VGAM2116 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2116 include diagnosis, prevention and treatment of viral infection by Cowpox virus. Specific functions, and accordingly utilities, of VGAM2116 correlate with, and may be deduced from, the identity of the host target genes which VGAM2116 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[29591] Nucleotide sequences of the VGAM2116 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the

diced VGAM2116 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2116 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2116 are further described hereinbelow with reference to Table 1.

[29592] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2116 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[29593] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2117 (VGAM2117) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[29594] VGAM2117 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2117 was detected is described hereinabove with reference to Figs. 2-8.

[29595] VGAM2117 gene, herein designated VGAM GENE, is a viral

gene contained in the genome of Cowpox virus. VGAM2117 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[29596] VGAM2117 gene, herein designated VGAM GENE, encodes a VGAM2117 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2117 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2117 precursor RNA is designated SEQ ID:2103, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2103 is located at position 206477 relative to the genome of Cowpox virus.

[29597] VGAM2117 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2117 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial

inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[29598] An enzyme complex designated DICER COMPLEX, dices the VGAM2117 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2117 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide sequence of VGAM2117 RNA is designated SEQ ID:4828, and is provided hereinbelow with reference to the sequence listing part.

[29599] VGAM2117 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2117 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2117 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[29600] VGAM2117 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2117 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2117 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2117 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2117 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[29601] The complementary binding of VGAM2117 RNA, herein

designated VGAM RNA, to host target binding sites on VGAM2117 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2117 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2117 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[29602] It is appreciated that VGAM2117 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2117 host target genes. The mRNA of each one of this plurality of VGAM2117 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2117 RNA, herein designated VGAM RNA, and which when bound by VGAM2117 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2117 host target proteins.

[29603] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2117 gene, herein designated VGAM GENE, on one or more VGAM2117 host target gene, herein designated

VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[29604] It is yet further appreciated that a function of VGAM2117 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2117 include diagnosis, prevention and treatment of viral infection by Cowpox virus. Specific functions, and accordingly utilities, of VGAM2117 correlate with, and may be deduced from, the identity of the host target genes which VGAM2117 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[29605] Nucleotide sequences of the VGAM2117 precursor RNA,

herein designated VGAM PRECURSOR RNA, and of the diced VGAM2117 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2117 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2117 are further described hereinbelow with reference to Table 1.

[29606] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2117 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[29607] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2118 (VGAM2118) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[29608] VGAM2118 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2118 was detected is described hereinabove with reference to Figs. 2-8.

[29609] VGAM2118 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cowpox virus. VGAM2118 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[29610] VGAM2118 gene, herein designated VGAM GENE, encodes a VGAM2118 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2118 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2118 precursor RNA is designated SEQ ID:2104, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2104 is located at position 6717 relative to the genome of Cowpox virus.

[29611] VGAM2118 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2118 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the

RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[29612] An enzyme complex designated DICER COMPLEX, dices the VGAM2118 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2118 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM2118 RNA is designated SEQ ID:4829, and is provided hereinbelow with reference to the sequence listing part.

[29613] VGAM2118 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2118 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2118 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN COD-

ING and 3UTR respectively.

[29614] VGAM2118 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2118 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2118 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2118 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2118 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[29615] The complementary binding of VGAM2118 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2118 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2118 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2118 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[29616] It is appreciated that VGAM2118 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2118 host target genes. The mRNA of each one of this plurality of VGAM2118 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2118 RNA, herein designated VGAM RNA, and which when bound by VGAM2118 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2118 host target proteins.

[29617] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2118 gene, herein designated VGAM GENE, on one

or more VGAM2118 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[29618] It is yet further appreciated that a function of VGAM2118 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2118 include diagnosis, prevention and treatment of viral infection by Cowpox virus. Specific functions, and accordingly utilities, of VGAM2118 correlate with, and may be deduced from, the identity of the host target genes which VGAM2118 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[29619] Nucleotide sequences of the VGAM2118 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2118 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2118 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2118 are further described hereinbelow with reference to Table 1.

[29620] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2118 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[29621] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2119 (VGAM2119) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[29622] VGAM2119 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2119 was detected is de-

scribed hereinabove with reference to Figs. 2-8.

[29623] VGAM2119 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cowpox virus. VGAM2119 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[29624] VGAM2119 gene, herein designated VGAM GENE, encodes a VGAM2119 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2119 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2119 precursor RNA is designated SEQ ID:2105, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2105 is located at position 206331 relative to the genome of Cowpox virus.

[29625] VGAM2119 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2119 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the

fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[29626] An enzyme complex designated DICER COMPLEX, dices the VGAM2119 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2119 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM2119 RNA is designated SEQ ID:4830, and is provided hereinbelow with reference to the sequence listing part.

[29627] VGAM2119 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2119 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2119 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and

a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[29628] VGAM2119 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2119 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2119 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2119 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2119 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both

3UTR and 5UTR regions.

[29629] The complementary binding of VGAM2119 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2119 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2119 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2119 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[29630] It is appreciated that VGAM2119 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2119 host target genes. The mRNA of each one of this plurality of VGAM2119 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2119 RNA, herein designated VGAM RNA, and which when bound by VGAM2119 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2119 host target proteins.

[29631] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by

VGAM2119 gene, herein designated VGAM GENE, on one or more VGAM2119 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[29632] It is yet further appreciated that a function of VGAM2119 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2119 include diagnosis, prevention and treatment of viral infection by Cowpox virus. Specific functions, and accordingly utilities, of VGAM2119 correlate with, and may be deduced from, the identity of the host target genes which VGAM2119 binds and inhibits, and the function of these host target genes, as elaborated

hereinbelow.

[29633] Nucleotide sequences of the VGAM2119 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2119 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2119 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2119 are further described hereinbelow with reference to Table 1.

[29634] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2119 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[29635] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2120 (VGAM2120) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[29636] VGAM2120 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene.

The method by which VGAM2120 was detected is described hereinabove with reference to Figs. 2-8.

[29637] VGAM2120 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cowpox virus. VGAM2120 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[29638] VGAM2120 gene, herein designated VGAM GENE, encodes a VGAM2120 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2120 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2120 precursor RNA is designated SEQ ID:2106, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2106 is located at position 214751 relative to the genome of Cowpox virus.

[29639] VGAM2120 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2120 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typi-

cal of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[29640] An enzyme complex designated DICER COMPLEX, dices the VGAM2120 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2120 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM2120 RNA is designated SEQ ID:4831, and is provided hereinbelow with reference to the sequence listing part.

[29641] VGAM2120 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2120 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2120 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding

gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[29642] VGAM2120 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2120 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2120 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2120 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2120 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be lo-

cated in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[29643] The complementary binding of VGAM2120 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2120 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2120 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2120 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[29644] It is appreciated that VGAM2120 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2120 host target genes. The mRNA of each one of this plurality of VGAM2120 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2120 RNA, herein designated VGAM RNA, and which when bound by VGAM2120 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2120 host target proteins.

[29645] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with

specific reference to translational inhibition exerted by VGAM2120 gene, herein designated VGAM GENE, on one or more VGAM2120 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[29646] It is yet further appreciated that a function of VGAM2120 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2120 include diagnosis, prevention and treatment of viral infection by Cowpox virus. Specific functions, and accordingly utilities, of VGAM2120 correlate with, and may be deduced from, the identity of the host target genes which VGAM2120 binds and inhibits,

and the function of these host target genes, as elaborated hereinbelow.

[29647] Nucleotide sequences of the VGAM2120 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2120 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2120 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2120 are further described hereinbelow with reference to Table 1.

[29648] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2120 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[29649] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2121 (VGAM2121) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[29650] VGAM2121 is a novel bioinformatically detected regula-

tory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2121 was detected is described hereinabove with reference to Figs. 2-8.

[29651] VGAM2121 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cowpox virus. VGAM2121 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[29652] VGAM2121 gene, herein designated VGAM GENE, encodes a VGAM2121 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2121 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2121 precursor RNA is designated SEQ ID:2107, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2107 is located at position 6122 relative to the genome of Cowpox virus.

[29653] VGAM2121 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2121 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure.

As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[29654] An enzyme complex designated DICER COMPLEX, dices the VGAM2121 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2121 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide sequence of VGAM2121 RNA is designated SEQ ID:4832, and is provided hereinbelow with reference to the sequence listing part.

[29655] VGAM2121 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2121 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2121 host target RNA, herein designated VGAM HOST TARGET RNA, comprises

three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[29656] VGAM2121 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2121 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2121 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2121 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2121 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an

example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[29657] The complementary binding of VGAM2121 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2121 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2121 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2121 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[29658] It is appreciated that VGAM2121 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2121 host target genes. The mRNA of each one of this plurality of VGAM2121 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2121 RNA, herein designated VGAM RNA, and which when bound by VGAM2121 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2121 host target proteins.

[29659] It is further appreciated by one skilled in the art that the

mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2121 gene, herein designated VGAM GENE, on one or more VGAM2121 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[29660] It is yet further appreciated that a function of VGAM2121 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2121 include diagnosis, prevention and treatment of viral infection by Cowpox virus. Specific functions, and accordingly utilities, of VGAM2121 correlate with, and may be deduced from, the identity of the

host target genes which VGAM2121 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[29661] Nucleotide sequences of the VGAM2121 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2121 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2121 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2121 are further described hereinbelow with reference to Table 1.

[29662] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2121 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[29663] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2122 (VGAM2122) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[29664] VGAM2122 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2122 was detected is described hereinabove with reference to Figs. 2-8.

[29665] VGAM2122 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cowpox virus. VGAM2122 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[29666] VGAM2122 gene, herein designated VGAM GENE, encodes a VGAM2122 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2122 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2122 precursor RNA is designated SEQ ID:2108, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2108 is located at position 5631 relative to the genome of Cowpox virus.

[29667] VGAM2122 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2122 folded precursor RNA, herein designated VGAM FOLDED PRECUR-

SOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[29668] An enzyme complex designated DICER COMPLEX, dices the VGAM2122 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2122 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 74%) nucleotide sequence of VGAM2122 RNA is designated SEQ ID:4833, and is provided hereinbelow with reference to the sequence listing part.

[29669] VGAM2122 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2122 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2122 host target RNA,

herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[29670] VGAM2122 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2122 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2122 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2122 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2122 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host tar-

get binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[29671] The complementary binding of VGAM2122 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2122 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2122 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2122 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[29672] It is appreciated that VGAM2122 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2122 host target genes. The mRNA of each one of this plurality of VGAM2122 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2122 RNA, herein designated VGAM RNA, and which when bound by VGAM2122 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2122 host target proteins.

[29673] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2122 gene, herein designated VGAM GENE, on one or more VGAM2122 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[29674] It is yet further appreciated that a function of VGAM2122 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2122 include diagnosis, prevention and treatment of viral infection by Cowpox virus. Specific functions, and accordingly utilities, of VGAM2122 corre-

late with, and may be deduced from, the identity of the host target genes which VGAM2122 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[29675] Nucleotide sequences of the VGAM2122 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2122 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2122 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2122 are further described hereinbelow with reference to Table 1.

[29676] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2122 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[29677] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2123 (VGAM2123) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the

art.

[29678] VGAM2123 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2123 was detected is described hereinabove with reference to Figs. 2-8.

[29679] VGAM2123 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cowpox virus. VGAM2123 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[29680] VGAM2123 gene, herein designated VGAM GENE, encodes a VGAM2123 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2123 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2123 precursor RNA is designated SEQ ID:2109, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2109 is located at position 208014 relative to the genome of Cowpox virus.

[29681] VGAM2123 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2123 folded

precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[29682] An enzyme complex designated DICER COMPLEX, dices the VGAM2123 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2123 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 45%) nucleotide sequence of VGAM2123 RNA is designated SEQ ID:4834, and is provided hereinbelow with reference to the sequence listing part.

[29683] VGAM2123 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2123 host target RNA, herein designated

VGAM HOST TARGET RNA. VGAM2123 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[29684] VGAM2123 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2123 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2123 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2123 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2123 host target RNA, herein designated VGAM HOST TARGET RNA.

It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[29685] The complementary binding of VGAM2123 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2123 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2123 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2123 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[29686] It is appreciated that VGAM2123 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2123 host target genes. The mRNA of each one of this plurality of VGAM2123 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2123 RNA, herein designated VGAM RNA, and which when bound by VGAM2123 RNA, herein designated VGAM RNA, causes inhibition of translation of

respective one or more VGAM2123 host target proteins.

[29687] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2123 gene, herein designated VGAM GENE, on one or more VGAM2123 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[29688] It is yet further appreciated that a function of VGAM2123 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2123 include diagnosis, prevention and treatment of viral infection by Cowpox virus. Specific

functions, and accordingly utilities, of VGAM2123 correlate with, and may be deduced from, the identity of the host target genes which VGAM2123 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[29689] Nucleotide sequences of the VGAM2123 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2123 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2123 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2123 are further described hereinbelow with reference to Table 1.

[29690] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2123 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[29691] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2124 (VGAM2124) viral gene, which modulates expression of respective host target genes thereof, the func-

tion and utility of which host target genes is known in the art.

[29692] VGAM2124 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2124 was detected is described hereinabove with reference to Figs. 2-8.

[29693] VGAM2124 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cowpox virus. VGAM2124 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[29694] VGAM2124 gene, herein designated VGAM GENE, encodes a VGAM2124 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2124 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2124 precursor RNA is designated SEQ ID:2110, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2110 is located at position 205910 relative to the genome of Cowpox virus.

[29695] VGAM2124 precursor RNA, herein designated VGAM PRE-

CURSOR RNA, folds onto itself, forming VGAM2124 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[29696] An enzyme complex designated DICER COMPLEX, dices the VGAM2124 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2124 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 53%) nucleotide sequence of VGAM2124 RNA is designated SEQ ID:4835, and is provided hereinbelow with reference to the sequence listing part.

[29697] VGAM2124 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger

RNA, VGAM2124 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2124 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[29698] VGAM2124 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2124 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2124 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2124 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2124 host

target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[29699] The complementary binding of VGAM2124 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2124 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2124 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2124 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[29700] It is appreciated that VGAM2124 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2124 host target genes. The mRNA of each one of this plurality of VGAM2124 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2124 RNA, herein designated VGAM RNA, and which when bound by VGAM2124 RNA, herein

designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2124 host target proteins.

[29701] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2124 gene, herein designated VGAM GENE, on one or more VGAM2124 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[29702] It is yet further appreciated that a function of VGAM2124 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2124 include diagnosis, prevention and

treatment of viral infection by Cowpox virus. Specific functions, and accordingly utilities, of VGAM2124 correlate with, and may be deduced from, the identity of the host target genes which VGAM2124 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[29703] Nucleotide sequences of the VGAM2124 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2124 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2124 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2124 are further described hereinbelow with reference to Table 1.

[29704] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2124 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[29705] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2125 (VGAM2125) viral gene, which modulates ex-

pression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[29706] VGAM2125 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2125 was detected is described hereinabove with reference to Figs. 2-8.

[29707] VGAM2125 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Ateline herpesvirus 3. VGAM2125 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[29708] VGAM2125 gene, herein designated VGAM GENE, encodes a VGAM2125 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2125 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2125 precursor RNA is designated SEQ ID:2111, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2111 is located at position 18618 relative to the genome of Ateline herpesvirus 3.

[29709] VGAM2125 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2125 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[29710] An enzyme complex designated DICER COMPLEX, dices the VGAM2125 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2125 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM2125 RNA is designated SEQ ID:4836, and is provided hereinbelow with reference to the sequence listing part.

[29711] VGAM2125 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2125 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2125 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[29712] VGAM2125 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2125 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2125 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2125 RNA, herein designated VGAM RNA, may have a different number of host target

binding sites in untranslated regions of a VGAM2125 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[29713] The complementary binding of VGAM2125 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2125 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2125 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2125 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[29714] It is appreciated that VGAM2125 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2125 host target genes. The mRNA of each one of this plurality of VGAM2125 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2125 RNA, herein designated VGAM

RNA, and which when bound by VGAM2125 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2125 host target proteins.

[29715] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2125 gene, herein designated VGAM GENE, on one or more VGAM2125 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[29716] It is yet further appreciated that a function of VGAM2125 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly,

utilities of VGAM2125 include diagnosis, prevention and treatment of viral infection by Ateline herpesvirus 3. Specific functions, and accordingly utilities, of VGAM2125 correlate with, and may be deduced from, the identity of the host target genes which VGAM2125 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[29717] Nucleotide sequences of the VGAM2125 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2125 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2125 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2125 are further described hereinbelow with reference to Table 1.

[29718] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2125 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[29719] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Mes-

senger 2126 (VGAM2126) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[29720] VGAM2126 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2126 was detected is described hereinabove with reference to Figs. 2-8.

[29721] VGAM2126 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Ateline herpesvirus 3. VGAM2126 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[29722] VGAM2126 gene, herein designated VGAM GENE, encodes a VGAM2126 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2126 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2126 precursor RNA is designated SEQ ID:2112, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2112 is located at position 6412

relative to the genome of Ateline herpesvirus 3.

[29723] VGAM2126 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2126 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[29724] An enzyme complex designated DICER COMPLEX, dices the VGAM2126 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2126 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 45%) nucleotide sequence of VGAM2126 RNA is designated SEQ ID:4837, and is provided hereinbelow with reference to the sequence listing part.

[29725] VGAM2126 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2126 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2126 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[29726] VGAM2126 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2126 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2126 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2126 RNA, herein designated

VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2126 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[29727] The complementary binding of VGAM2126 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2126 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2126 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2126 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[29728] It is appreciated that VGAM2126 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2126 host target genes. The mRNA of each one of this plurality of VGAM2126 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly com-

plementary to VGAM2126 RNA, herein designated VGAM RNA, and which when bound by VGAM2126 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2126 host target proteins.

[29729] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2126 gene, herein designated VGAM GENE, on one or more VGAM2126 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[29730] It is yet further appreciated that a function of VGAM2126 is inhibition of expression of host target genes, as part of

a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2126 include diagnosis, prevention and treatment of viral infection by Ateline herpesvirus 3. Specific functions, and accordingly utilities, of VGAM2126 correlate with, and may be deduced from, the identity of the host target genes which VGAM2126 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[29731] Nucleotide sequences of the VGAM2126 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2126 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2126 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2126 are further described hereinbelow with reference to Table 1.

[29732] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2126 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[29733] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present

invention, referred to here as Viral Genomic Address Messenger 2127 (VGAM2127) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[29734] VGAM2127 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2127 was detected is described hereinabove with reference to Figs. 2-8.

[29735] VGAM2127 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Ateline herpesvirus 3. VGAM2127 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[29736] VGAM2127 gene, herein designated VGAM GENE, encodes a VGAM2127 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2127 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2127 precursor RNA is designated SEQ ID:2113, and is provided hereinbelow with reference to the sequence listing part. Nu-

cleotide sequence SEQ ID:2113 is located at position 22317 relative to the genome of Ateline herpesvirus 3.

[29737] VGAM2127 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2127 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[29738] An enzyme complex designated DICER COMPLEX, dices the VGAM2127 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2127 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 86%) nucleotide sequence of VGAM2127 RNA is designated SEQ ID:4838, and is provided hereinbelow with reference to the sequence

listing part.

[29739] VGAM2127 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2127 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2127 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[29740] VGAM2127 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2127 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2127 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not

meant to be limiting VGAM2127 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2127 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[29741] The complementary binding of VGAM2127 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2127 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2127 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2127 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[29742] It is appreciated that VGAM2127 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2127 host target genes. The mRNA of each one of this plurality of VGAM2127 host target genes comprises one or more host target binding sites, each

having a nucleotide sequence which is at least partly complementary to VGAM2127 RNA, herein designated VGAM RNA, and which when bound by VGAM2127 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2127 host target proteins.

[29743] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2127 gene, herein designated VGAM GENE, on one or more VGAM2127 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[29744] It is yet further appreciated that a function of VGAM2127

is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2127 include diagnosis, prevention and treatment of viral infection by Ateline herpesvirus 3. Specific functions, and accordingly utilities, of VGAM2127 correlate with, and may be deduced from, the identity of the host target genes which VGAM2127 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[29745] Nucleotide sequences of the VGAM2127 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2127 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2127 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2127 are further described hereinbelow with reference to Table 1.

[29746] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2127 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[29747] Fig. 1 further provides a conceptual description of another

novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2128 (VGAM2128) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[29748] VGAM2128 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2128 was detected is described hereinabove with reference to Figs. 2-8.

[29749] VGAM2128 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Ateline herpesvirus 3. VGAM2128 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[29750] VGAM2128 gene, herein designated VGAM GENE, encodes a VGAM2128 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2128 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2128 precursor RNA is designated SEQ ID:2114, and is provided here-

inbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2114 is located at position 22124 relative to the genome of Ateline herpesvirus 3.

[29751] VGAM2128 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2128 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[29752] An enzyme complex designated DICER COMPLEX, dices the VGAM2128 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2128 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 44%) nucleotide sequence of VGAM2128 RNA is designated SEQ ID:4839, and

is provided hereinbelow with reference to the sequence listing part.

[29753] VGAM2128 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2128 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2128 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[29754] VGAM2128 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2128 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2128 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites

shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2128 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2128 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[29755] The complementary binding of VGAM2128 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2128 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2128 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2128 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[29756] It is appreciated that VGAM2128 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2128 host target genes. The mRNA of each one of this plurality of VGAM2128 host target genes

comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2128 RNA, herein designated VGAM RNA, and which when bound by VGAM2128 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2128 host target proteins.

[29757] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2128 gene, herein designated VGAM GENE, on one or more VGAM2128 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[29758] It is yet further appreciated that a function of VGAM2128 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2128 include diagnosis, prevention and treatment of viral infection by Ateline herpesvirus 3. Specific functions, and accordingly utilities, of VGAM2128 correlate with, and may be deduced from, the identity of the host target genes which VGAM2128 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[29759] Nucleotide sequences of the VGAM2128 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2128 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2128 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2128 are further described hereinbelow with reference to Table 1.

[29760] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2128 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[29761] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2129 (VGAM2129) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[29762] VGAM2129 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2129 was detected is described hereinabove with reference to Figs. 2-8.

[29763] VGAM2129 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Ateline herpesvirus 3. VGAM2129 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[29764] VGAM2129 gene, herein designated VGAM GENE, encodes a VGAM2129 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2129 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2129 precur-

sor RNA is designated SEQ ID:2115, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2115 is located at position 9401 relative to the genome of Ateline herpesvirus 3.

[29765] VGAM2129 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2129 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[29766] An enzyme complex designated DICER COMPLEX, dices the VGAM2129 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2129 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide se-

quence of VGAM2129 RNA is designated SEQ ID:4840, and is provided hereinbelow with reference to the sequence listing part.

[29767] VGAM2129 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2129 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2129 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[29768] VGAM2129 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2129 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2129 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is ap-

preciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2129 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2129 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[29769] The complementary binding of VGAM2129 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2129 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2129 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2129 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[29770] It is appreciated that VGAM2129 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2129 host target genes. The mRNA of

each one of this plurality of VGAM2129 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2129 RNA, herein designated VGAM RNA, and which when bound by VGAM2129 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2129 host target proteins.

[29771] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2129 gene, herein designated VGAM GENE, on one or more VGAM2129 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science

294,779 (2001)).

[29772] It is yet further appreciated that a function of VGAM2129 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2129 include diagnosis, prevention and treatment of viral infection by Ateline herpesvirus 3. Specific functions, and accordingly utilities, of VGAM2129 correlate with, and may be deduced from, the identity of the host target genes which VGAM2129 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[29773] Nucleotide sequences of the VGAM2129 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2129 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2129 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2129 are further described hereinbelow with reference to Table 1.

[29774] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2129 RNA, herein designated VGAM RNA, are de-

scribed hereinbelow with reference to Table 2.

[29775] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2130 (VGAM2130) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[29776] VGAM2130 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2130 was detected is described hereinabove with reference to Figs. 2-8.

[29777] VGAM2130 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Ateline herpesvirus 3. VGAM2130 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[29778] VGAM2130 gene, herein designated VGAM GENE, encodes a VGAM2130 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2130 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly

similar to the nucleotide sequence of VGAM2130 precursor RNA is designated SEQ ID:2116, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2116 is located at position 23005 relative to the genome of Ateline herpesvirus 3.

[29779] VGAM2130 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2130 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[29780] An enzyme complex designated DICER COMPLEX, dices the VGAM2130 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2130 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other

necessary proteins. A probable (over 40%) nucleotide sequence of VGAM2130 RNA is designated SEQ ID:4841, and is provided hereinbelow with reference to the sequence listing part.

[29781] VGAM2130 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2130 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2130 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[29782] VGAM2130 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2130 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2130 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I,

BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2130 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2130 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[29783] The complementary binding of VGAM2130 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2130 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2130 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2130 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[29784] It is appreciated that VGAM2130 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents

a plurality of VGAM2130 host target genes. The mRNA of each one of this plurality of VGAM2130 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2130 RNA, herein designated VGAM RNA, and which when bound by VGAM2130 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2130 host target proteins.

[29785] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2130 gene, herein designated VGAM GENE, on one or more VGAM2130 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[29786] It is yet further appreciated that a function of VGAM2130 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2130 include diagnosis, prevention and treatment of viral infection by Ateline herpesvirus 3. Specific functions, and accordingly utilities, of VGAM2130 correlate with, and may be deduced from, the identity of the host target genes which VGAM2130 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[29787] Nucleotide sequences of the VGAM2130 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2130 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2130 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2130 are further described hereinbelow with reference to Table 1.

[29788] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites

to VGAM2130 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[29789] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2131 (VGAM2131) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[29790] VGAM2131 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2131 was detected is described hereinabove with reference to Figs. 2-8.

[29791] VGAM2131 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Ateline herpesvirus 3. VGAM2131 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[29792] VGAM2131 gene, herein designated VGAM GENE, encodes a VGAM2131 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2131 precursor RNA, herein designated VGAM PRECURSOR RNA, does not en-

code a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2131 precursor RNA is designated SEQ ID:2117, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2117 is located at position 9609 relative to the genome of Ateline herpesvirus 3.

[29793] VGAM2131 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2131 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[29794] An enzyme complex designated DICER COMPLEX, dices the VGAM2131 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2131 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer together with other necessary proteins. A probable (over 44%) nucleotide sequence of VGAM2131 RNA is designated SEQ ID:4842, and is provided hereinbelow with reference to the sequence listing part.

[29795] VGAM2131 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2131 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2131 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[29796] VGAM2131 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2131 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2131 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3

such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2131 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2131 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[29797] The complementary binding of VGAM2131 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2131 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2131 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2131 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[29798] It is appreciated that VGAM2131 host target gene, herein

designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2131 host target genes. The mRNA of each one of this plurality of VGAM2131 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2131 RNA, herein designated VGAM RNA, and which when bound by VGAM2131 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2131 host target proteins.

[29799] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2131 gene, herein designated VGAM GENE, on one or more VGAM2131 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these

other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[29800] It is yet further appreciated that a function of VGAM2131 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2131 include diagnosis, prevention and treatment of viral infection by Ateline herpesvirus 3. Specific functions, and accordingly utilities, of VGAM2131 correlate with, and may be deduced from, the identity of the host target genes which VGAM2131 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[29801] Nucleotide sequences of the VGAM2131 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2131 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2131 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2131 are further described hereinbelow with reference to Table 1.

[29802] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the

complementarity of each of these host target binding sites to VGAM2131 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[29803] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2132 (VGAM2132) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[29804] VGAM2132 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2132 was detected is described hereinabove with reference to Figs. 2-8.

[29805] VGAM2132 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Ateline herpesvirus 3. VGAM2132 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[29806] VGAM2132 gene, herein designated VGAM GENE, encodes a VGAM2132 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2132 precursor RNA,

herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2132 precursor RNA is designated SEQ ID:2118, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2118 is located at position 17602 relative to the genome of Ateline herpesvirus 3.

[29807] VGAM2132 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2132 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[29808] An enzyme complex designated DICER COMPLEX, dices the VGAM2132 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2132 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short

~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 57%) nucleotide sequence of VGAM2132 RNA is designated SEQ ID:4843, and is provided hereinbelow with reference to the sequence listing part.

[29809] VGAM2132 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2132 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2132 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[29810] VGAM2132 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2132 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2132 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host

target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2132 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2132 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[29811] The complementary binding of VGAM2132 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2132 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2132 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2132 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[29812] It is appreciated that VGAM2132 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2132 host target genes. The mRNA of each one of this plurality of VGAM2132 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2132 RNA, herein designated VGAM RNA, and which when bound by VGAM2132 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2132 host target proteins.

[29813] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2132 gene, herein designated VGAM GENE, on one or more VGAM2132 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, al-

though specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[29814] It is yet further appreciated that a function of VGAM2132 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2132 include diagnosis, prevention and treatment of viral infection by Ateline herpesvirus 3. Specific functions, and accordingly utilities, of VGAM2132 correlate with, and may be deduced from, the identity of the host target genes which VGAM2132 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[29815] Nucleotide sequences of the VGAM2132 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2132 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2132 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2132 are further described hereinbelow with reference to Table 1.

[29816] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of

Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2132 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[29817] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2133 (VGAM2133) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[29818] VGAM2133 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2133 was detected is described hereinabove with reference to Figs. 2-8.

[29819] VGAM2133 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Ateline herpesvirus 3. VGAM2133 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[29820] VGAM2133 gene, herein designated VGAM GENE, encodes a VGAM2133 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and un-

like most ordinary genes, VGAM2133 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2133 precursor RNA is designated SEQ ID:2119, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2119 is located at position 4296 relative to the genome of Ateline herpesvirus 3.

[29821] VGAM2133 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2133 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[29822] An enzyme complex designated DICER COMPLEX, dices the VGAM2133 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2133 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a

hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 45%) nucleotide sequence of VGAM2133 RNA is designated SEQ ID:4844, and is provided hereinbelow with reference to the sequence listing part.

[29823] VGAM2133 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2133 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2133 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[29824] VGAM2133 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2133 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2133 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed

sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2133 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2133 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[29825] The complementary binding of VGAM2133 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2133 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2133 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2133 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target

protein is therefore outlined by a broken line.

[29826] It is appreciated that VGAM2133 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2133 host target genes. The mRNA of each one of this plurality of VGAM2133 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2133 RNA, herein designated VGAM RNA, and which when bound by VGAM2133 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2133 host target proteins.

[29827] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2133 gene, herein designated VGAM GENE, on one or more VGAM2133 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate ex-

pression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[29828] It is yet further appreciated that a function of VGAM2133 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2133 include diagnosis, prevention and treatment of viral infection by Ateline herpesvirus 3. Specific functions, and accordingly utilities, of VGAM2133 correlate with, and may be deduced from, the identity of the host target genes which VGAM2133 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[29829] Nucleotide sequences of the VGAM2133 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2133 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2133 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2133 are further described hereinbelow with reference to Table 1.

[29830] Nucleotide sequences of host target binding sites, such as

BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2133 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[29831] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2134 (VGAM2134) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[29832] VGAM2134 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2134 was detected is described hereinabove with reference to Figs. 2-8.

[29833] VGAM2134 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Ateline herpesvirus 3. VGAM2134 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[29834] VGAM2134 gene, herein designated VGAM GENE, encodes a VGAM2134 precursor RNA, herein designated VGAM

PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2134 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2134 precursor RNA is designated SEQ ID:2120, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2120 is located at position 20245 relative to the genome of Ateline herpesvirus 3.

[29835] VGAM2134 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2134 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[29836] An enzyme complex designated DICER COMPLEX, dices the VGAM2134 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2134 RNA, herein designated VGAM RNA, a single stranded ~22 nt

long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 65%) nucleotide sequence of VGAM2134 RNA is designated SEQ ID:4845, and is provided hereinbelow with reference to the sequence listing part.

[29837] VGAM2134 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2134 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2134 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[29838] VGAM2134 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2134 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2134 RNA, herein designated

VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2134 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2134 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[29839] The complementary binding of VGAM2134 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2134 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2134 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2134 host target protein, herein desig-

nated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[29840] It is appreciated that VGAM2134 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2134 host target genes. The mRNA of each one of this plurality of VGAM2134 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2134 RNA, herein designated VGAM RNA, and which when bound by VGAM2134 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2134 host target proteins.

[29841] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2134 gene, herein designated VGAM GENE, on one or more VGAM2134 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are

also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[29842] It is yet further appreciated that a function of VGAM2134 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2134 include diagnosis, prevention and treatment of viral infection by Ateline herpesvirus 3. Specific functions, and accordingly utilities, of VGAM2134 correlate with, and may be deduced from, the identity of the host target genes which VGAM2134 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[29843] Nucleotide sequences of the VGAM2134 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2134 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2134 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2134 are further described hereinbelow with reference to Table 1.

[29844] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2134 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[29845] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2135 (VGAM2135) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[29846] VGAM2135 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2135 was detected is described hereinabove with reference to Figs. 2-8.

[29847] VGAM2135 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Ateline herpesvirus 3. VGAM2135 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[29848] VGAM2135 gene, herein designated VGAM GENE, encodes

a VGAM2135 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2135 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2135 precursor RNA is designated SEQ ID:2121, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2121 is located at position 17990 relative to the genome of Ateline herpesvirus 3.

[29849] VGAM2135 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2135 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[29850] An enzyme complex designated DICER COMPLEX, dices the VGAM2135 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2135 RNA,

herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide sequence of VGAM2135 RNA is designated SEQ ID:4846, and is provided hereinbelow with reference to the sequence listing part.

[29851] VGAM2135 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2135 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2135 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[29852] VGAM2135 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2135 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nu-

cleotide sequence of VGAM2135 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2135 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2135 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[29853] The complementary binding of VGAM2135 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2135 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2135 host target RNA, herein designated VGAM HOST TARGET

RNA, into VGAM2135 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[29854] It is appreciated that VGAM2135 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2135 host target genes. The mRNA of each one of this plurality of VGAM2135 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2135 RNA, herein designated VGAM RNA, and which when bound by VGAM2135 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2135 host target proteins.

[29855] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2135 gene, herein designated VGAM GENE, on one or more VGAM2135 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4

and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[29856] It is yet further appreciated that a function of VGAM2135 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2135 include diagnosis, prevention and treatment of viral infection by Ateline herpesvirus 3. Specific functions, and accordingly utilities, of VGAM2135 correlate with, and may be deduced from, the identity of the host target genes which VGAM2135 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[29857] Nucleotide sequences of the VGAM2135 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2135 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2135 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2135 are further

described hereinbelow with reference to Table 1.

[29858] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2135 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[29859] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2136 (VGAM2136) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[29860] VGAM2136 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2136 was detected is described hereinabove with reference to Figs. 2-8.

[29861] VGAM2136 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Ectromelia virus. VGAM2136 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[29862] VGAM2136 gene, herein designated VGAM GENE, encodes a VGAM2136 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2136 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2136 precursor RNA is designated SEQ ID:2122, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2122 is located at position 176642 relative to the genome of Ectromelia virus.

[29863] VGAM2136 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2136 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[29864] An enzyme complex designated DICER COMPLEX, dices the VGAM2136 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, into VGAM2136 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 92%) nucleotide sequence of VGAM2136 RNA is designated SEQ ID:4847, and is provided hereinbelow with reference to the sequence listing part.

[29865] VGAM2136 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2136 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2136 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[29866] VGAM2136 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2136 host target RNA, herein designated VGAM HOST TARGET RNA. This

complementary binding is due to the fact that the nucleotide sequence of VGAM2136 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2136 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2136 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[29867] The complementary binding of VGAM2136 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2136 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2136

host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2136 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[29868] It is appreciated that VGAM2136 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2136 host target genes. The mRNA of each one of this plurality of VGAM2136 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2136 RNA, herein designated VGAM RNA, and which when bound by VGAM2136 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2136 host target proteins.

[29869] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2136 gene, herein designated VGAM GENE, on one or more VGAM2136 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated

only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[29870] It is yet further appreciated that a function of VGAM2136 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2136 include diagnosis, prevention and treatment of viral infection by Ectromelia virus. Specific functions, and accordingly utilities, of VGAM2136 correlate with, and may be deduced from, the identity of the host target genes which VGAM2136 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[29871] Nucleotide sequences of the VGAM2136 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2136 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2136 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, of VGAM2136 are further described hereinbelow with reference to Table 1.

[29872] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2136 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[29873] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2137 (VGAM2137) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[29874] VGAM2137 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2137 was detected is described hereinabove with reference to Figs. 2-8.

[29875] VGAM2137 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Ectromelia virus. VGAM2137 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the

human genome.

[29876] VGAM2137 gene, herein designated VGAM GENE, encodes a VGAM2137 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2137 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2137 precursor RNA is designated SEQ ID:2123, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2123 is located at position 174026 relative to the genome of Ectromelia virus.

[29877] VGAM2137 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2137 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[29878] An enzyme complex designated DICER COMPLEX, dices

the VGAM2137 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2137 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM2137 RNA is designated SEQ ID:4848, and is provided hereinbelow with reference to the sequence listing part.

[29879] VGAM2137 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2137 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2137 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[29880] VGAM2137 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2137 host target

RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2137 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2137 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2137 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[29881] The complementary binding of VGAM2137 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2137 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE

II and BINDING SITE III, inhibits translation of VGAM2137 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2137 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[29882] It is appreciated that VGAM2137 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2137 host target genes. The mRNA of each one of this plurality of VGAM2137 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2137 RNA, herein designated VGAM RNA, and which when bound by VGAM2137 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2137 host target proteins.

[29883] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2137 gene, herein designated VGAM GENE, on one or more VGAM2137 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a spe-

cific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[29884] It is yet further appreciated that a function of VGAM2137 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2137 include diagnosis, prevention and treatment of viral infection by Ectromelia virus. Specific functions, and accordingly utilities, of VGAM2137 correlate with, and may be deduced from, the identity of the host target genes which VGAM2137 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[29885] Nucleotide sequences of the VGAM2137 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2137 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of

VGAM2137 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2137 are further described hereinbelow with reference to Table 1.

[29886] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2137 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[29887] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2138 (VGAM2138) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[29888] VGAM2138 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2138 was detected is described hereinabove with reference to Figs. 2-8.

[29889] VGAM2138 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Ectromelia virus. VGAM2138 host target gene, herein designated VGAM

HOST TARGET GENE, is a human gene contained in the human genome.

[29890] VGAM2138 gene, herein designated VGAM GENE, encodes a VGAM2138 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2138 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2138 precursor RNA is designated SEQ ID:2124, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2124 is located at position 168635 relative to the genome of Ectromelia virus.

[29891] VGAM2138 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2138 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[29892] An enzyme complex designated DICER COMPLEX, dices the VGAM2138 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2138 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM2138 RNA is designated SEQ ID:4849, and is provided hereinbelow with reference to the sequence listing part.

[29893] VGAM2138 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2138 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2138 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[29894] VGAM2138 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites

located in untranslated regions of VGAM2138 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2138 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2138 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2138 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[29895] The complementary binding of VGAM2138 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2138 host target RNA, herein designated VGAM

HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2138 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2138 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[29896] It is appreciated that VGAM2138 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2138 host target genes. The mRNA of each one of this plurality of VGAM2138 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2138 RNA, herein designated VGAM RNA, and which when bound by VGAM2138 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2138 host target proteins.

[29897] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2138 gene, herein designated VGAM GENE, on one or more VGAM2138 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove

with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[29898] It is yet further appreciated that a function of VGAM2138 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2138 include diagnosis, prevention and treatment of viral infection by Ectromelia virus. Specific functions, and accordingly utilities, of VGAM2138 correlate with, and may be deduced from, the identity of the host target genes which VGAM2138 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[29899] Nucleotide sequences of the VGAM2138 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2138 RNA, herein designated VGAM RNA, and

a schematic representation of the secondary folding of VGAM2138 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2138 are further described hereinbelow with reference to Table 1.

[29900] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2138 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[29901] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2139 (VGAM2139) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[29902] VGAM2139 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2139 was detected is described hereinabove with reference to Figs. 2-8.

[29903] VGAM2139 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Ectromelia virus.

VGAM2139 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[29904] VGAM2139 gene, herein designated VGAM GENE, encodes a VGAM2139 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2139 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2139 precursor RNA is designated SEQ ID:2125, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2125 is located at position 179020 relative to the genome of Ectromelia virus.

[29905] VGAM2139 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2139 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of

the second half thereof.

[29906] An enzyme complex designated DICER COMPLEX, dices the VGAM2139 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2139 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 45%) nucleotide sequence of VGAM2139 RNA is designated SEQ ID:4850, and is provided hereinbelow with reference to the sequence listing part.

[29907] VGAM2139 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2139 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2139 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[29908] VGAM2139 RNA, herein designated VGAM RNA, binds

complementarily to one or more host target binding sites located in untranslated regions of VGAM2139 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2139 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2139 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2139 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[29909] The complementary binding of VGAM2139 RNA, herein designated VGAM RNA, to host target binding sites on

VGAM2139 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2139 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2139 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[29910] It is appreciated that VGAM2139 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2139 host target genes. The mRNA of each one of this plurality of VGAM2139 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2139 RNA, herein designated VGAM RNA, and which when bound by VGAM2139 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2139 host target proteins.

[29911] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2139 gene, herein designated VGAM GENE, on one or more VGAM2139 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other

known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[29912] It is yet further appreciated that a function of VGAM2139 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2139 include diagnosis, prevention and treatment of viral infection by Ectromelia virus. Specific functions, and accordingly utilities, of VGAM2139 correlate with, and may be deduced from, the identity of the host target genes which VGAM2139 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[29913] Nucleotide sequences of the VGAM2139 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the

diced VGAM2139 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2139 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2139 are further described hereinbelow with reference to Table 1.

[29914] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2139 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[29915] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2140 (VGAM2140) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[29916] VGAM2140 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2140 was detected is described hereinabove with reference to Figs. 2-8.

[29917] VGAM2140 gene, herein designated VGAM GENE, is a viral

gene contained in the genome of Ectromelia virus. VGAM2140 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[29918] VGAM2140 gene, herein designated VGAM GENE, encodes a VGAM2140 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2140 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2140 precursor RNA is designated SEQ ID:2126, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2126 is located at position 172080 relative to the genome of Ectromelia virus.

[29919] VGAM2140 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2140 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial

inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[29920] An enzyme complex designated DICER COMPLEX, dices the VGAM2140 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2140 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 70%) nucleotide sequence of VGAM2140 RNA is designated SEQ ID:4851, and is provided hereinbelow with reference to the sequence listing part.

[29921] VGAM2140 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2140 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2140 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[29922] VGAM2140 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2140 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2140 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2140 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2140 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[29923] The complementary binding of VGAM2140 RNA, herein

designated VGAM RNA, to host target binding sites on VGAM2140 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2140 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2140 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[29924] It is appreciated that VGAM2140 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2140 host target genes. The mRNA of each one of this plurality of VGAM2140 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2140 RNA, herein designated VGAM RNA, and which when bound by VGAM2140 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2140 host target proteins.

[29925] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2140 gene, herein designated VGAM GENE, on one or more VGAM2140 host target gene, herein designated

VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[29926] It is yet further appreciated that a function of VGAM2140 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2140 include diagnosis, prevention and treatment of viral infection by Ectromelia virus. Specific functions, and accordingly utilities, of VGAM2140 correlate with, and may be deduced from, the identity of the host target genes which VGAM2140 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[29927] Nucleotide sequences of the VGAM2140 precursor RNA,

herein designated VGAM PRECURSOR RNA, and of the diced VGAM2140 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2140 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2140 are further described hereinbelow with reference to Table 1.

[29928] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2140 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[29929] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2141 (VGAM2141) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[29930] VGAM2141 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2141 was detected is described hereinabove with reference to Figs. 2-8.

[29931] VGAM2141 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Ectromelia virus. VGAM2141 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[29932] VGAM2141 gene, herein designated VGAM GENE, encodes a VGAM2141 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2141 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2141 precursor RNA is designated SEQ ID:2127, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2127 is located at position 169712 relative to the genome of Ectromelia virus.

[29933] VGAM2141 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2141 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the

RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[29934] An enzyme complex designated DICER COMPLEX, dices the VGAM2141 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2141 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM2141 RNA is designated SEQ ID:4852, and is provided hereinbelow with reference to the sequence listing part.

[29935] VGAM2141 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2141 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2141 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN COD-

ING and 3UTR respectively.

[29936] VGAM2141 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2141 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2141 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2141 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2141 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[29937] The complementary binding of VGAM2141 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2141 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2141 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2141 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[29938] It is appreciated that VGAM2141 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2141 host target genes. The mRNA of each one of this plurality of VGAM2141 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2141 RNA, herein designated VGAM RNA, and which when bound by VGAM2141 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2141 host target proteins.

[29939] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2141 gene, herein designated VGAM GENE, on one

or more VGAM2141 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[29940] It is yet further appreciated that a function of VGAM2141 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2141 include diagnosis, prevention and treatment of viral infection by Ectromelia virus. Specific functions, and accordingly utilities, of VGAM2141 correlate with, and may be deduced from, the identity of the host target genes which VGAM2141 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[29941] Nucleotide sequences of the VGAM2141 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2141 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2141 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2141 are further described hereinbelow with reference to Table 1.

[29942] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2141 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[29943] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2142 (VGAM2142) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[29944] VGAM2142 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2142 was detected is de-

scribed hereinabove with reference to Figs. 2-8.

[29945] VGAM2142 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Ectromelia virus. VGAM2142 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[29946] VGAM2142 gene, herein designated VGAM GENE, encodes a VGAM2142 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2142 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2142 precursor RNA is designated SEQ ID:2128, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2128 is located at position 168447 relative to the genome of Ectromelia virus.

[29947] VGAM2142 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2142 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the

fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[29948] An enzyme complex designated DICER COMPLEX, dices the VGAM2142 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2142 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM2142 RNA is designated SEQ ID:4853, and is provided hereinbelow with reference to the sequence listing part.

[29949] VGAM2142 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2142 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2142 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and

a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[29950] VGAM2142 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2142 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2142 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2142 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2142 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both

3UTR and 5UTR regions.

[29951] The complementary binding of VGAM2142 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2142 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2142 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2142 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[29952] It is appreciated that VGAM2142 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2142 host target genes. The mRNA of each one of this plurality of VGAM2142 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2142 RNA, herein designated VGAM RNA, and which when bound by VGAM2142 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2142 host target proteins.

[29953] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by

VGAM2142 gene, herein designated VGAM GENE, on one or more VGAM2142 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[29954] It is yet further appreciated that a function of VGAM2142 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2142 include diagnosis, prevention and treatment of viral infection by Ectromelia virus. Specific functions, and accordingly utilities, of VGAM2142 correlate with, and may be deduced from, the identity of the host target genes which VGAM2142 binds and inhibits, and the function of these host target genes, as elaborated

hereinbelow.

[29955] Nucleotide sequences of the VGAM2142 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2142 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2142 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2142 are further described hereinbelow with reference to Table 1.

[29956] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2142 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[29957] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2143 (VGAM2143) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[29958] VGAM2143 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene.

The method by which VGAM2143 was detected is described hereinabove with reference to Figs. 2-8.

[29959] VGAM2143 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Ectromelia virus. VGAM2143 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[29960] VGAM2143 gene, herein designated VGAM GENE, encodes a VGAM2143 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2143 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2143 precursor RNA is designated SEQ ID:2129, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2129 is located at position 165143 relative to the genome of Ectromelia virus.

[29961] VGAM2143 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2143 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typi-

cal of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[29962] An enzyme complex designated DICER COMPLEX, dices the VGAM2143 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2143 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide sequence of VGAM2143 RNA is designated SEQ ID:4854, and is provided hereinbelow with reference to the sequence listing part.

[29963] VGAM2143 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2143 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2143 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding

gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[29964] VGAM2143 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2143 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2143 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2143 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2143 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be lo-

cated in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[29965] The complementary binding of VGAM2143 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2143 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2143 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2143 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[29966] It is appreciated that VGAM2143 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2143 host target genes. The mRNA of each one of this plurality of VGAM2143 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2143 RNA, herein designated VGAM RNA, and which when bound by VGAM2143 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2143 host target proteins.

[29967] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with

specific reference to translational inhibition exerted by VGAM2143 gene, herein designated VGAM GENE, on one or more VGAM2143 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[29968] It is yet further appreciated that a function of VGAM2143 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2143 include diagnosis, prevention and treatment of viral infection by Ectromelia virus. Specific functions, and accordingly utilities, of VGAM2143 correlate with, and may be deduced from, the identity of the host target genes which VGAM2143 binds and inhibits,

and the function of these host target genes, as elaborated hereinbelow.

[29969] Nucleotide sequences of the VGAM2143 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2143 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2143 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2143 are further described hereinbelow with reference to Table 1.

[29970] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2143 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[29971] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2144 (VGAM2144) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[29972] VGAM2144 is a novel bioinformatically detected regula-

tory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2144 was detected is described hereinabove with reference to Figs. 2-8.

[29973] VGAM2144 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Ectromelia virus. VGAM2144 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[29974] VGAM2144 gene, herein designated VGAM GENE, encodes a VGAM2144 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2144 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2144 precursor RNA is designated SEQ ID:2130, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2130 is located at position 168263 relative to the genome of Ectromelia virus.

[29975] VGAM2144 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2144 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure.

As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[29976] An enzyme complex designated DICER COMPLEX, dices the VGAM2144 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2144 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM2144 RNA is designated SEQ ID:4855, and is provided hereinbelow with reference to the sequence listing part.

[29977] VGAM2144 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2144 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2144 host target RNA, herein designated VGAM HOST TARGET RNA, comprises

three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[29978] VGAM2144 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2144 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2144 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2144 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2144 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an

example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[29979] The complementary binding of VGAM2144 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2144 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2144 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2144 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[29980] It is appreciated that VGAM2144 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2144 host target genes. The mRNA of each one of this plurality of VGAM2144 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2144 RNA, herein designated VGAM RNA, and which when bound by VGAM2144 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2144 host target proteins.

[29981] It is further appreciated by one skilled in the art that the

mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2144 gene, herein designated VGAM GENE, on one or more VGAM2144 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[29982] It is yet further appreciated that a function of VGAM2144 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2144 include diagnosis, prevention and treatment of viral infection by Ectromelia virus. Specific functions, and accordingly utilities, of VGAM2144 correlate with, and may be deduced from, the identity of the

host target genes which VGAM2144 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[29983] Nucleotide sequences of the VGAM2144 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2144 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2144 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2144 are further described hereinbelow with reference to Table 1.

[29984] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2144 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[29985] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2145 (VGAM2145) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[29986] VGAM2145 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2145 was detected is described hereinabove with reference to Figs. 2-8.

[29987] VGAM2145 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Ectromelia virus. VGAM2145 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[29988] VGAM2145 gene, herein designated VGAM GENE, encodes a VGAM2145 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2145 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2145 precursor RNA is designated SEQ ID:2131, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2131 is located at position 182220 relative to the genome of Ectromelia virus.

[29989] VGAM2145 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2145 folded precursor RNA, herein designated VGAM FOLDED PRECUR-

SOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[29990] An enzyme complex designated DICER COMPLEX, dices the VGAM2145 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2145 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM2145 RNA is designated SEQ ID:4856, and is provided hereinbelow with reference to the sequence listing part.

[29991] VGAM2145 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2145 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2145 host target RNA,

herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[29992] VGAM2145 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2145 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2145 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2145 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2145 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host tar-

get binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[29993] The complementary binding of VGAM2145 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2145 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2145 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2145 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[29994] It is appreciated that VGAM2145 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2145 host target genes. The mRNA of each one of this plurality of VGAM2145 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2145 RNA, herein designated VGAM RNA, and which when bound by VGAM2145 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2145 host target proteins.

[29995] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2145 gene, herein designated VGAM GENE, on one or more VGAM2145 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[29996] It is yet further appreciated that a function of VGAM2145 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2145 include diagnosis, prevention and treatment of viral infection by Ectromelia virus. Specific functions, and accordingly utilities, of VGAM2145 corre-

late with, and may be deduced from, the identity of the host target genes which VGAM2145 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[29997] Nucleotide sequences of the VGAM2145 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2145 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2145 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2145 are further described hereinbelow with reference to Table 1.

[29998] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2145 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[29999] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2146 (VGAM2146) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the

art.

[30000] VGAM2146 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2146 was detected is described hereinabove with reference to Figs. 2-8.

[30001] VGAM2146 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rana tigrina ranavirus. VGAM2146 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[30002] VGAM2146 gene, herein designated VGAM GENE, encodes a VGAM2146 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2146 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2146 precursor RNA is designated SEQ ID:2132, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2132 is located at position 55138 relative to the genome of Rana tigrina ranavirus.

[30003] VGAM2146 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2146 folded

precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[30004] An enzyme complex designated DICER COMPLEX, dices the VGAM2146 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2146 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide sequence of VGAM2146 RNA is designated SEQ ID:4857, and is provided hereinbelow with reference to the sequence listing part.

[30005] VGAM2146 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2146 host target RNA, herein designated

VGAM HOST TARGET RNA. VGAM2146 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[30006] VGAM2146 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2146 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2146 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2146 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2146 host target RNA, herein designated VGAM HOST TARGET RNA.

It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[30007] The complementary binding of VGAM2146 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2146 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2146 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2146 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[30008] It is appreciated that VGAM2146 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2146 host target genes. The mRNA of each one of this plurality of VGAM2146 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2146 RNA, herein designated VGAM RNA, and which when bound by VGAM2146 RNA, herein designated VGAM RNA, causes inhibition of translation of

respective one or more VGAM2146 host target proteins.

[30009] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2146 gene, herein designated VGAM GENE, on one or more VGAM2146 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[30010] It is yet further appreciated that a function of VGAM2146 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2146 include diagnosis, prevention and treatment of viral infection by Rana tigrina ranavirus. Spe-

cific functions, and accordingly utilities, of VGAM2146 correlate with, and may be deduced from, the identity of the host target genes which VGAM2146 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[30011] Nucleotide sequences of the VGAM2146 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2146 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2146 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2146 are further described hereinbelow with reference to Table 1.

[30012] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2146 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[30013] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2147 (VGAM2147) viral gene, which modulates expression of respective host target genes thereof, the func-

tion and utility of which host target genes is known in the art.

[30014] VGAM2147 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2147 was detected is described hereinabove with reference to Figs. 2-8.

[30015] VGAM2147 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rana tigrina ranavirus. VGAM2147 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[30016] VGAM2147 gene, herein designated VGAM GENE, encodes a VGAM2147 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2147 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2147 precursor RNA is designated SEQ ID:2133, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2133 is located at position 47097 relative to the genome of Rana tigrina ranavirus.

[30017] VGAM2147 precursor RNA, herein designated VGAM PRE-

CURSOR RNA, folds onto itself, forming VGAM2147 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[30018] An enzyme complex designated DICER COMPLEX, dices the VGAM2147 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2147 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 49%) nucleotide sequence of VGAM2147 RNA is designated SEQ ID:4858, and is provided hereinbelow with reference to the sequence listing part.

[30019] VGAM2147 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger

RNA, VGAM2147 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2147 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[30020] VGAM2147 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2147 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2147 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2147 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2147 host

target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[30021] The complementary binding of VGAM2147 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2147 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2147 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2147 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[30022] It is appreciated that VGAM2147 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2147 host target genes. The mRNA of each one of this plurality of VGAM2147 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2147 RNA, herein designated VGAM RNA, and which when bound by VGAM2147 RNA, herein

designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2147 host target proteins.

[30023] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2147 gene, herein designated VGAM GENE, on one or more VGAM2147 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[30024] It is yet further appreciated that a function of VGAM2147 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2147 include diagnosis, prevention and

treatment of viral infection by Rana tigrina ranavirus. Specific functions, and accordingly utilities, of VGAM2147 correlate with, and may be deduced from, the identity of the host target genes which VGAM2147 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[30025] Nucleotide sequences of the VGAM2147 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2147 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2147 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2147 are further described hereinbelow with reference to Table 1.

[30026] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2147 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[30027] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2148 (VGAM2148) viral gene, which modulates ex-

pression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[30028] VGAM2148 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2148 was detected is described hereinabove with reference to Figs. 2-8.

[30029] VGAM2148 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rana tigrina ranavirus. VGAM2148 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[30030] VGAM2148 gene, herein designated VGAM GENE, encodes a VGAM2148 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2148 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2148 precursor RNA is designated SEQ ID:2134, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2134 is located at position 62911 relative to the genome of Rana tigrina ranavirus.

[30031] VGAM2148 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2148 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[30032] An enzyme complex designated DICER COMPLEX, dices the VGAM2148 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2148 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 73%) nucleotide sequence of VGAM2148 RNA is designated SEQ ID:4859, and is provided hereinbelow with reference to the sequence listing part.

[30033] VGAM2148 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2148 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2148 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[30034] VGAM2148 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2148 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2148 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2148 RNA, herein designated VGAM RNA, may have a different number of host target

binding sites in untranslated regions of a VGAM2148 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[30035] The complementary binding of VGAM2148 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2148 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2148 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2148 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[30036] It is appreciated that VGAM2148 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2148 host target genes. The mRNA of each one of this plurality of VGAM2148 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2148 RNA, herein designated VGAM

RNA, and which when bound by VGAM2148 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2148 host target proteins.

[30037] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2148 gene, herein designated VGAM GENE, on one or more VGAM2148 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[30038] It is yet further appreciated that a function of VGAM2148 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly,

utilities of VGAM2148 include diagnosis, prevention and treatment of viral infection by Rana tigrina ranavirus. Specific functions, and accordingly utilities, of VGAM2148 correlate with, and may be deduced from, the identity of the host target genes which VGAM2148 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[30039] Nucleotide sequences of the VGAM2148 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2148 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2148 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2148 are further described hereinbelow with reference to Table 1.

[30040] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2148 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[30041] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Mes-

senger 2149 (VGAM2149) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[30042] VGAM2149 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2149 was detected is described hereinabove with reference to Figs. 2-8.

[30043] VGAM2149 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rana tigrina ranavirus. VGAM2149 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[30044] VGAM2149 gene, herein designated VGAM GENE, encodes a VGAM2149 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2149 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2149 precursor RNA is designated SEQ ID:2135, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2135 is located at position

50593 relative to the genome of Rana tigrina ranavirus.

[30045] VGAM2149 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2149 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[30046] An enzyme complex designated DICER COMPLEX, dices the VGAM2149 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2149 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM2149 RNA is designated SEQ ID:4860, and is provided hereinbelow with reference to the sequence listing part.

[30047] VGAM2149 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2149 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2149 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[30048] VGAM2149 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2149 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2149 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2149 RNA, herein designated

VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2149 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[30049] The complementary binding of VGAM2149 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2149 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2149 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2149 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[30050] It is appreciated that VGAM2149 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2149 host target genes. The mRNA of each one of this plurality of VGAM2149 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly com-

plementary to VGAM2149 RNA, herein designated VGAM RNA, and which when bound by VGAM2149 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2149 host target proteins.

[30051] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2149 gene, herein designated VGAM GENE, on one or more VGAM2149 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[30052] It is yet further appreciated that a function of VGAM2149 is inhibition of expression of host target genes, as part of

a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2149 include diagnosis, prevention and treatment of viral infection by Rana tigrina ranavirus. Specific functions, and accordingly utilities, of VGAM2149 correlate with, and may be deduced from, the identity of the host target genes which VGAM2149 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[30053] Nucleotide sequences of the VGAM2149 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2149 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2149 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2149 are further described hereinbelow with reference to Table 1.

[30054] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2149 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[30055] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present

invention, referred to here as Viral Genomic Address Messenger 2150 (VGAM2150) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[30056] VGAM2150 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2150 was detected is described hereinabove with reference to Figs. 2-8.

[30057] VGAM2150 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rana tigrina ranavirus. VGAM2150 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[30058] VGAM2150 gene, herein designated VGAM GENE, encodes a VGAM2150 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2150 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2150 precursor RNA is designated SEQ ID:2136, and is provided hereinbelow with reference to the sequence listing part. Nu-

cleotide sequence SEQ ID:2136 is located at position 52091 relative to the genome of Rana tigrina ranavirus.

[30059] VGAM2150 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2150 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[30060] An enzyme complex designated DICER COMPLEX, dices the VGAM2150 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2150 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 52%) nucleotide sequence of VGAM2150 RNA is designated SEQ ID:4861, and is provided hereinbelow with reference to the sequence

listing part.

[30061] VGAM2150 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2150 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2150 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[30062] VGAM2150 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2150 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2150 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not

meant to be limiting VGAM2150 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2150 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[30063] The complementary binding of VGAM2150 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2150 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2150 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2150 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[30064] It is appreciated that VGAM2150 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2150 host target genes. The mRNA of each one of this plurality of VGAM2150 host target genes comprises one or more host target binding sites, each

having a nucleotide sequence which is at least partly complementary to VGAM2150 RNA, herein designated VGAM RNA, and which when bound by VGAM2150 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2150 host target proteins.

[30065] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2150 gene, herein designated VGAM GENE, on one or more VGAM2150 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[30066] It is yet further appreciated that a function of VGAM2150

is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2150 include diagnosis, prevention and treatment of viral infection by Rana tigrina ranavirus. Specific functions, and accordingly utilities, of VGAM2150 correlate with, and may be deduced from, the identity of the host target genes which VGAM2150 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[30067] Nucleotide sequences of the VGAM2150 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2150 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2150 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2150 are further described hereinbelow with reference to Table 1.

[30068] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2150 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[30069] Fig. 1 further provides a conceptual description of another

novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2151 (VGAM2151) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[30070] VGAM2151 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2151 was detected is described hereinabove with reference to Figs. 2-8.

[30071] VGAM2151 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rana tigrina ranavirus. VGAM2151 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[30072] VGAM2151 gene, herein designated VGAM GENE, encodes a VGAM2151 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2151 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2151 precursor RNA is designated SEQ ID:2137, and is provided here-

inbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2137 is located at position 54437 relative to the genome of Rana tigrina ranavirus.

[30073] VGAM2151 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2151 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[30074] An enzyme complex designated DICER COMPLEX, dices the VGAM2151 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2151 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 45%) nucleotide sequence of VGAM2151 RNA is designated SEQ ID:4862, and

is provided hereinbelow with reference to the sequence listing part.

[30075] VGAM2151 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2151 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2151 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[30076] VGAM2151 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2151 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2151 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites

shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2151 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2151 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[30077] The complementary binding of VGAM2151 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2151 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2151 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2151 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[30078] It is appreciated that VGAM2151 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2151 host target genes. The mRNA of each one of this plurality of VGAM2151 host target genes

comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2151 RNA, herein designated VGAM RNA, and which when bound by VGAM2151 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2151 host target proteins.

[30079] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2151 gene, herein designated VGAM GENE, on one or more VGAM2151 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[30080] It is yet further appreciated that a function of VGAM2151 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2151 include diagnosis, prevention and treatment of viral infection by Rana tigrina ranavirus. Specific functions, and accordingly utilities, of VGAM2151 correlate with, and may be deduced from, the identity of the host target genes which VGAM2151 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[30081] Nucleotide sequences of the VGAM2151 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2151 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2151 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2151 are further described hereinbelow with reference to Table 1.

[30082] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2151 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[30083] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2152 (VGAM2152) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[30084] VGAM2152 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2152 was detected is described hereinabove with reference to Figs. 2-8.

[30085] VGAM2152 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rana tigrina ranavirus. VGAM2152 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[30086] VGAM2152 gene, herein designated VGAM GENE, encodes a VGAM2152 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2152 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2152 precur-

sor RNA is designated SEQ ID:2138, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2138 is located at position 44423 relative to the genome of Rana tigrina ranavirus.

[30087] VGAM2152 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2152 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[30088] An enzyme complex designated DICER COMPLEX, dices the VGAM2152 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2152 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide se-

quence of VGAM2152 RNA is designated SEQ ID:4863, and is provided hereinbelow with reference to the sequence listing part.

[30089] VGAM2152 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2152 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2152 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[30090] VGAM2152 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2152 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2152 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is ap-

preciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2152 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2152 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[30091] The complementary binding of VGAM2152 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2152 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2152 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2152 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[30092] It is appreciated that VGAM2152 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2152 host target genes. The mRNA of

each one of this plurality of VGAM2152 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2152 RNA, herein designated VGAM RNA, and which when bound by VGAM2152 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2152 host target proteins.

[30093] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2152 gene, herein designated VGAM GENE, on one or more VGAM2152 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science

294,779 (2001)).

[30094] It is yet further appreciated that a function of VGAM2152 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2152 include diagnosis, prevention and treatment of viral infection by Rana tigrina ranavirus. Specific functions, and accordingly utilities, of VGAM2152 correlate with, and may be deduced from, the identity of the host target genes which VGAM2152 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[30095] Nucleotide sequences of the VGAM2152 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2152 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2152 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2152 are further described hereinbelow with reference to Table 1.

[30096] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2152 RNA, herein designated VGAM RNA, are de-

scribed hereinbelow with reference to Table 2.

[30097] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2153 (VGAM2153) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[30098] VGAM2153 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2153 was detected is described hereinabove with reference to Figs. 2-8.

[30099] VGAM2153 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rana tigrina ranavirus. VGAM2153 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[30100] VGAM2153 gene, herein designated VGAM GENE, encodes a VGAM2153 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2153 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly

similar to the nucleotide sequence of VGAM2153 precursor RNA is designated SEQ ID:2139, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2139 is located at position 59440 relative to the genome of Rana tigrina ranavirus.

[30101] VGAM2153 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2153 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[30102] An enzyme complex designated DICER COMPLEX, dices the VGAM2153 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2153 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other

necessary proteins. A probable (over 45%) nucleotide sequence of VGAM2153 RNA is designated SEQ ID:4864, and is provided hereinbelow with reference to the sequence listing part.

[30103] VGAM2153 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2153 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2153 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[30104] VGAM2153 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2153 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2153 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I,

BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2153 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2153 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[30105] The complementary binding of VGAM2153 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2153 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2153 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2153 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[30106] It is appreciated that VGAM2153 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents

a plurality of VGAM2153 host target genes. The mRNA of each one of this plurality of VGAM2153 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2153 RNA, herein designated VGAM RNA, and which when bound by VGAM2153 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2153 host target proteins.

[30107] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2153 gene, herein designated VGAM GENE, on one or more VGAM2153 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[30108] It is yet further appreciated that a function of VGAM2153 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2153 include diagnosis, prevention and treatment of viral infection by Rana tigrina ranavirus. Specific functions, and accordingly utilities, of VGAM2153 correlate with, and may be deduced from, the identity of the host target genes which VGAM2153 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[30109] Nucleotide sequences of the VGAM2153 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2153 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2153 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2153 are further described hereinbelow with reference to Table 1.

[30110] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites

to VGAM2153 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[30111] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2154 (VGAM2154) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[30112] VGAM2154 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2154 was detected is described hereinabove with reference to Figs. 2-8.

[30113] VGAM2154 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rana tigrina ranavirus. VGAM2154 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[30114] VGAM2154 gene, herein designated VGAM GENE, encodes a VGAM2154 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2154 precursor RNA, herein designated VGAM PRECURSOR RNA, does not en-

code a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2154 precursor RNA is designated SEQ ID:2140, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2140 is located at position 48817 relative to the genome of Rana tigrina ranavirus.

[30115] VGAM2154 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2154 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[30116] An enzyme complex designated DICER COMPLEX, dices the VGAM2154 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2154 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer together with other necessary proteins. A probable (over 70%) nucleotide sequence of VGAM2154 RNA is designated SEQ ID:4865, and is provided hereinbelow with reference to the sequence listing part.

[30117] VGAM2154 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2154 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2154 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[30118] VGAM2154 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2154 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2154 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3

such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2154 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2154 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[30119] The complementary binding of VGAM2154 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2154 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2154 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2154 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[30120] It is appreciated that VGAM2154 host target gene, herein

designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2154 host target genes. The mRNA of each one of this plurality of VGAM2154 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2154 RNA, herein designated VGAM RNA, and which when bound by VGAM2154 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2154 host target proteins.

[30121] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2154 gene, herein designated VGAM GENE, on one or more VGAM2154 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these

other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[30122] It is yet further appreciated that a function of VGAM2154 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2154 include diagnosis, prevention and treatment of viral infection by Rana tigrina ranavirus. Specific functions, and accordingly utilities, of VGAM2154 correlate with, and may be deduced from, the identity of the host target genes which VGAM2154 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[30123] Nucleotide sequences of the VGAM2154 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2154 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2154 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2154 are further described hereinbelow with reference to Table 1.

[30124] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the

complementarity of each of these host target binding sites to VGAM2154 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[30125] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2155 (VGAM2155) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[30126] VGAM2155 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2155 was detected is described hereinabove with reference to Figs. 2-8.

[30127] VGAM2155 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Monkeypox virus. VGAM2155 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[30128] VGAM2155 gene, herein designated VGAM GENE, encodes a VGAM2155 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2155 precursor RNA,

herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2155 precursor RNA is designated SEQ ID:2141, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2141 is located at position 168488 relative to the genome of Monkeypox virus.

[30129] VGAM2155 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2155 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[30130] An enzyme complex designated DICER COMPLEX, dices the VGAM2155 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2155 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short

~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM2155 RNA is designated SEQ ID:4866, and is provided hereinbelow with reference to the sequence listing part.

[30131] VGAM2155 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2155 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2155 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[30132] VGAM2155 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2155 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2155 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host

target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2155 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2155 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[30133] The complementary binding of VGAM2155 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2155 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2155 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2155 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[30134] It is appreciated that VGAM2155 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2155 host target genes. The mRNA of each one of this plurality of VGAM2155 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2155 RNA, herein designated VGAM RNA, and which when bound by VGAM2155 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2155 host target proteins.

[30135] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2155 gene, herein designated VGAM GENE, on one or more VGAM2155 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, al-

though specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[30136] It is yet further appreciated that a function of VGAM2155 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2155 include diagnosis, prevention and treatment of viral infection by Monkeypox virus. Specific functions, and accordingly utilities, of VGAM2155 correlate with, and may be deduced from, the identity of the host target genes which VGAM2155 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[30137] Nucleotide sequences of the VGAM2155 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2155 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2155 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2155 are further described hereinbelow with reference to Table 1.

[30138] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of

Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2155 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[30139] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2156 (VGAM2156) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[30140] VGAM2156 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2156 was detected is described hereinabove with reference to Figs. 2-8.

[30141] VGAM2156 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Monkeypox virus. VGAM2156 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[30142] VGAM2156 gene, herein designated VGAM GENE, encodes a VGAM2156 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and un-

like most ordinary genes, VGAM2156 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2156 precursor RNA is designated SEQ ID:2142, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2142 is located at position 170622 relative to the genome of Monkeypox virus.

[30143] VGAM2156 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2156 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[30144] An enzyme complex designated DICER COMPLEX, dices the VGAM2156 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2156 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a

hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 59%) nucleotide sequence of VGAM2156 RNA is designated SEQ ID:4867, and is provided hereinbelow with reference to the sequence listing part.

[30145] VGAM2156 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2156 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2156 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[30146] VGAM2156 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2156 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2156 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed

sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2156 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2156 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[30147] The complementary binding of VGAM2156 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2156 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2156 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2156 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target

protein is therefore outlined by a broken line.

[30148] It is appreciated that VGAM2156 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2156 host target genes. The mRNA of each one of this plurality of VGAM2156 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2156 RNA, herein designated VGAM RNA, and which when bound by VGAM2156 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2156 host target proteins.

[30149] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2156 gene, herein designated VGAM GENE, on one or more VGAM2156 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate ex-

pression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[30150] It is yet further appreciated that a function of VGAM2156 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2156 include diagnosis, prevention and treatment of viral infection by Monkeypox virus. Specific functions, and accordingly utilities, of VGAM2156 correlate with, and may be deduced from, the identity of the host target genes which VGAM2156 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[30151] Nucleotide sequences of the VGAM2156 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2156 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2156 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2156 are further described hereinbelow with reference to Table 1.

[30152] Nucleotide sequences of host target binding sites, such as

BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2156 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[30153] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2157 (VGAM2157) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[30154] VGAM2157 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2157 was detected is described hereinabove with reference to Figs. 2-8.

[30155] VGAM2157 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Monkeypox virus. VGAM2157 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[30156] VGAM2157 gene, herein designated VGAM GENE, encodes a VGAM2157 precursor RNA, herein designated VGAM

PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2157 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2157 precursor RNA is designated SEQ ID:2143, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2143 is located at position 162621 relative to the genome of Monkeypox virus.

[30157] VGAM2157 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2157 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[30158] An enzyme complex designated DICER COMPLEX, dices the VGAM2157 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2157 RNA, herein designated VGAM RNA, a single stranded ~22 nt

long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 46%) nucleotide sequence of VGAM2157 RNA is designated SEQ ID:4868, and is provided hereinbelow with reference to the sequence listing part.

[30159] VGAM2157 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2157 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2157 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[30160] VGAM2157 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2157 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2157 RNA, herein designated

VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2157 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2157 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[30161] The complementary binding of VGAM2157 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2157 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2157 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2157 host target protein, herein desig-

nated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[30162] It is appreciated that VGAM2157 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2157 host target genes. The mRNA of each one of this plurality of VGAM2157 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2157 RNA, herein designated VGAM RNA, and which when bound by VGAM2157 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2157 host target proteins.

[30163] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2157 gene, herein designated VGAM GENE, on one or more VGAM2157 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are

also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[30164] It is yet further appreciated that a function of VGAM2157 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2157 include diagnosis, prevention and treatment of viral infection by Monkeypox virus. Specific functions, and accordingly utilities, of VGAM2157 correlate with, and may be deduced from, the identity of the host target genes which VGAM2157 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[30165] Nucleotide sequences of the VGAM2157 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2157 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2157 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2157 are further described hereinbelow with reference to Table 1.

[30166] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2157 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[30167] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2158 (VGAM2158) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[30168] VGAM2158 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2158 was detected is described hereinabove with reference to Figs. 2-8.

[30169] VGAM2158 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Monkeypox virus. VGAM2158 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[30170] VGAM2158 gene, herein designated VGAM GENE, encodes

a VGAM2158 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2158 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2158 precursor RNA is designated SEQ ID:2144, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2144 is located at position 165985 relative to the genome of Monkeypox virus.

[30171] VGAM2158 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2158 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[30172] An enzyme complex designated DICER COMPLEX, dices the VGAM2158 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2158 RNA,

herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 44%) nucleotide sequence of VGAM2158 RNA is designated SEQ ID:4869, and is provided hereinbelow with reference to the sequence listing part.

[30173] VGAM2158 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2158 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2158 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[30174] VGAM2158 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2158 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nu-

cleotide sequence of VGAM2158 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2158 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2158 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[30175] The complementary binding of VGAM2158 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2158 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2158 host target RNA, herein designated VGAM HOST TARGET

RNA, into VGAM2158 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[30176] It is appreciated that VGAM2158 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2158 host target genes. The mRNA of each one of this plurality of VGAM2158 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2158 RNA, herein designated VGAM RNA, and which when bound by VGAM2158 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2158 host target proteins.

[30177] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2158 gene, herein designated VGAM GENE, on one or more VGAM2158 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4

and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[30178] It is yet further appreciated that a function of VGAM2158 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2158 include diagnosis, prevention and treatment of viral infection by Monkeypox virus. Specific functions, and accordingly utilities, of VGAM2158 correlate with, and may be deduced from, the identity of the host target genes which VGAM2158 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[30179] Nucleotide sequences of the VGAM2158 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2158 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2158 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2158 are further

described hereinbelow with reference to Table 1.

[30180] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2158 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[30181] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2159 (VGAM2159) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[30182] VGAM2159 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2159 was detected is described hereinabove with reference to Figs. 2-8.

[30183] VGAM2159 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Monkeypox virus. VGAM2159 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[30184] VGAM2159 gene, herein designated VGAM GENE, encodes a VGAM2159 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2159 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2159 precursor RNA is designated SEQ ID:2145, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2145 is located at position 155355 relative to the genome of Monkeypox virus.

[30185] VGAM2159 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2159 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[30186] An enzyme complex designated DICER COMPLEX, dices the VGAM2159 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, into VGAM2159 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide sequence of VGAM2159 RNA is designated SEQ ID:4870, and is provided hereinbelow with reference to the sequence listing part.

[30187] VGAM2159 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2159 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2159 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[30188] VGAM2159 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2159 host target RNA, herein designated VGAM HOST TARGET RNA. This

complementary binding is due to the fact that the nucleotide sequence of VGAM2159 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2159 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2159 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[30189] The complementary binding of VGAM2159 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2159 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2159

host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2159 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[30190] It is appreciated that VGAM2159 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2159 host target genes. The mRNA of each one of this plurality of VGAM2159 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2159 RNA, herein designated VGAM RNA, and which when bound by VGAM2159 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2159 host target proteins.

[30191] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2159 gene, herein designated VGAM GENE, on one or more VGAM2159 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated

only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[30192] It is yet further appreciated that a function of VGAM2159 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2159 include diagnosis, prevention and treatment of viral infection by Monkeypox virus. Specific functions, and accordingly utilities, of VGAM2159 correlate with, and may be deduced from, the identity of the host target genes which VGAM2159 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[30193] Nucleotide sequences of the VGAM2159 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2159 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2159 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, of VGAM2159 are further described hereinbelow with reference to Table 1.

[30194] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2159 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[30195] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2160 (VGAM2160) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[30196] VGAM2160 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2160 was detected is described hereinabove with reference to Figs. 2-8.

[30197] VGAM2160 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Monkeypox virus. VGAM2160 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the

human genome.

[30198] VGAM2160 gene, herein designated VGAM GENE, encodes a VGAM2160 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2160 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2160 precursor RNA is designated SEQ ID:2146, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2146 is located at position 168205 relative to the genome of Monkeypox virus.

[30199] VGAM2160 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2160 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[30200] An enzyme complex designated DICER COMPLEX, dices

the VGAM2160 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2160 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 49%) nucleotide sequence of VGAM2160 RNA is designated SEQ ID:4871, and is provided hereinbelow with reference to the sequence listing part.

[30201] VGAM2160 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2160 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2160 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[30202] VGAM2160 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2160 host target

RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2160 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2160 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2160 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[30203] The complementary binding of VGAM2160 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2160 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE

II and BINDING SITE III, inhibits translation of VGAM2160 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2160 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[30204] It is appreciated that VGAM2160 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2160 host target genes. The mRNA of each one of this plurality of VGAM2160 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2160 RNA, herein designated VGAM RNA, and which when bound by VGAM2160 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2160 host target proteins.

[30205] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2160 gene, herein designated VGAM GENE, on one or more VGAM2160 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a spe-

cific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[30206] It is yet further appreciated that a function of VGAM2160 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2160 include diagnosis, prevention and treatment of viral infection by Monkeypox virus. Specific functions, and accordingly utilities, of VGAM2160 correlate with, and may be deduced from, the identity of the host target genes which VGAM2160 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[30207] Nucleotide sequences of the VGAM2160 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2160 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of

VGAM2160 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2160 are further described hereinbelow with reference to Table 1.

[30208] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2160 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[30209] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2161 (VGAM2161) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[30210] VGAM2161 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2161 was detected is described hereinabove with reference to Figs. 2-8.

[30211] VGAM2161 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Camelpox virus. VGAM2161 host target gene, herein designated VGAM

HOST TARGET GENE, is a human gene contained in the human genome.

[30212] VGAM2161 gene, herein designated VGAM GENE, encodes a VGAM2161 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2161 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2161 precursor RNA is designated SEQ ID:2147, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2147 is located at position 194827 relative to the genome of Camelpox virus.

[30213] VGAM2161 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2161 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[30214] An enzyme complex designated DICER COMPLEX, dices the VGAM2161 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2161 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 44%) nucleotide sequence of VGAM2161 RNA is designated SEQ ID:4872, and is provided hereinbelow with reference to the sequence listing part.

[30215] VGAM2161 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2161 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2161 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[30216] VGAM2161 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites

located in untranslated regions of VGAM2161 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2161 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2161 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2161 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[30217] The complementary binding of VGAM2161 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2161 host target RNA, herein designated VGAM

HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2161 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2161 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[30218] It is appreciated that VGAM2161 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2161 host target genes. The mRNA of each one of this plurality of VGAM2161 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2161 RNA, herein designated VGAM RNA, and which when bound by VGAM2161 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2161 host target proteins.

[30219] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2161 gene, herein designated VGAM GENE, on one or more VGAM2161 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove

with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[30220] It is yet further appreciated that a function of VGAM2161 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2161 include diagnosis, prevention and treatment of viral infection by Camelpox virus. Specific functions, and accordingly utilities, of VGAM2161 correlate with, and may be deduced from, the identity of the host target genes which VGAM2161 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[30221] Nucleotide sequences of the VGAM2161 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2161 RNA, herein designated VGAM RNA, and

a schematic representation of the secondary folding of VGAM2161 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2161 are further described hereinbelow with reference to Table 1.

[30222] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2161 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[30223] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2162 (VGAM2162) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[30224] VGAM2162 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2162 was detected is described hereinabove with reference to Figs. 2-8.

[30225] VGAM2162 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Camelpox virus.

VGAM2162 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[30226] VGAM2162 gene, herein designated VGAM GENE, encodes a VGAM2162 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2162 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2162 precursor RNA is designated SEQ ID:2148, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2148 is located at position 195253 relative to the genome of Camelpox virus.

[30227] VGAM2162 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2162 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of

the second half thereof.

[30228] An enzyme complex designated DICER COMPLEX, dices the VGAM2162 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2162 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 52%) nucleotide sequence of VGAM2162 RNA is designated SEQ ID:4873, and is provided hereinbelow with reference to the sequence listing part.

[30229] VGAM2162 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2162 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2162 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[30230] VGAM2162 RNA, herein designated VGAM RNA, binds

complementarily to one or more host target binding sites located in untranslated regions of VGAM2162 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2162 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2162 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2162 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[30231] The complementary binding of VGAM2162 RNA, herein designated VGAM RNA, to host target binding sites on

VGAM2162 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2162 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2162 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[30232] It is appreciated that VGAM2162 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2162 host target genes. The mRNA of each one of this plurality of VGAM2162 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2162 RNA, herein designated VGAM RNA, and which when bound by VGAM2162 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2162 host target proteins.

[30233] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2162 gene, herein designated VGAM GENE, on one or more VGAM2162 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other

known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[30234] It is yet further appreciated that a function of VGAM2162 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2162 include diagnosis, prevention and treatment of viral infection by Camelpox virus. Specific functions, and accordingly utilities, of VGAM2162 correlate with, and may be deduced from, the identity of the host target genes which VGAM2162 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[30235] Nucleotide sequences of the VGAM2162 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the

diced VGAM2162 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2162 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2162 are further described hereinbelow with reference to Table 1.

[30236] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2162 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[30237] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2163 (VGAM2163) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[30238] VGAM2163 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2163 was detected is described hereinabove with reference to Figs. 2-8.

[30239] VGAM2163 gene, herein designated VGAM GENE, is a viral

gene contained in the genome of Camelpox virus. VGAM2163 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[30240] VGAM2163 gene, herein designated VGAM GENE, encodes a VGAM2163 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2163 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2163 precursor RNA is designated SEQ ID:2149, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2149 is located at position 184394 relative to the genome of Camelpox virus.

[30241] VGAM2163 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2163 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial

inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[30242] An enzyme complex designated DICER COMPLEX, dices the VGAM2163 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2163 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 44%) nucleotide sequence of VGAM2163 RNA is designated SEQ ID:4874, and is provided hereinbelow with reference to the sequence listing part.

[30243] VGAM2163 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2163 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2163 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[30244] VGAM2163 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2163 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2163 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2163 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2163 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[30245] The complementary binding of VGAM2163 RNA, herein

designated VGAM RNA, to host target binding sites on VGAM2163 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2163 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2163 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[30246] It is appreciated that VGAM2163 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2163 host target genes. The mRNA of each one of this plurality of VGAM2163 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2163 RNA, herein designated VGAM RNA, and which when bound by VGAM2163 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2163 host target proteins.

[30247] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2163 gene, herein designated VGAM GENE, on one or more VGAM2163 host target gene, herein designated

VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[30248] It is yet further appreciated that a function of VGAM2163 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2163 include diagnosis, prevention and treatment of viral infection by Camelpox virus. Specific functions, and accordingly utilities, of VGAM2163 correlate with, and may be deduced from, the identity of the host target genes which VGAM2163 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[30249] Nucleotide sequences of the VGAM2163 precursor RNA,

herein designated VGAM PRECURSOR RNA, and of the diced VGAM2163 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2163 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2163 are further described hereinbelow with reference to Table 1.

[30250] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2163 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[30251] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2164 (VGAM2164) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[30252] VGAM2164 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2164 was detected is described hereinabove with reference to Figs. 2-8.

[30253] VGAM2164 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Parsnip yellow fleck virus. VGAM2164 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[30254] VGAM2164 gene, herein designated VGAM GENE, encodes a VGAM2164 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2164 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2164 precursor RNA is designated SEQ ID:2150, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2150 is located at position 4805 relative to the genome of Parsnip yellow fleck virus.

[30255] VGAM2164 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2164 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the

RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[30256] An enzyme complex designated DICER COMPLEX, dices the VGAM2164 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2164 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 46%) nucleotide sequence of VGAM2164 RNA is designated SEQ ID:4875, and is provided hereinbelow with reference to the sequence listing part.

[30257] VGAM2164 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2164 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2164 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN COD-

ING and 3UTR respectively.

[30258] VGAM2164 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2164 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2164 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2164 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2164 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[30259] The complementary binding of VGAM2164 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2164 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2164 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2164 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[30260] It is appreciated that VGAM2164 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2164 host target genes. The mRNA of each one of this plurality of VGAM2164 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2164 RNA, herein designated VGAM RNA, and which when bound by VGAM2164 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2164 host target proteins.

[30261] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2164 gene, herein designated VGAM GENE, on one

or more VGAM2164 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[30262] It is yet further appreciated that a function of VGAM2164 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2164 include diagnosis, prevention and treatment of viral infection by Parsnip yellow fleck virus. Specific functions, and accordingly utilities, of VGAM2164 correlate with, and may be deduced from, the identity of the host target genes which VGAM2164 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[30263] Nucleotide sequences of the VGAM2164 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2164 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2164 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2164 are further described hereinbelow with reference to Table 1.

[30264] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2164 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[30265] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2165 (VGAM2165) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[30266] VGAM2165 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2165 was detected is de-

scribed hereinabove with reference to Figs. 2-8.

[30267] VGAM2165 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Camelpox virus. VGAM2165 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[30268] VGAM2165 gene, herein designated VGAM GENE, encodes a VGAM2165 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2165 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2165 precursor RNA is designated SEQ ID:2151, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2151 is located at position 196786 relative to the genome of Camelpox virus.

[30269] VGAM2165 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2165 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the

fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[30270] An enzyme complex designated DICER COMPLEX, dices the VGAM2165 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2165 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 44%) nucleotide sequence of VGAM2165 RNA is designated SEQ ID:4876, and is provided hereinbelow with reference to the sequence listing part.

[30271] VGAM2165 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2165 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2165 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and

a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[30272] VGAM2165 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2165 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2165 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2165 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2165 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both

3UTR and 5UTR regions.

[30273] The complementary binding of VGAM2165 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2165 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2165 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2165 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[30274] It is appreciated that VGAM2165 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2165 host target genes. The mRNA of each one of this plurality of VGAM2165 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2165 RNA, herein designated VGAM RNA, and which when bound by VGAM2165 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2165 host target proteins.

[30275] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by

VGAM2165 gene, herein designated VGAM GENE, on one or more VGAM2165 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[30276] It is yet further appreciated that a function of VGAM2165 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2165 include diagnosis, prevention and treatment of viral infection by Camelpox virus. Specific functions, and accordingly utilities, of VGAM2165 correlate with, and may be deduced from, the identity of the host target genes which VGAM2165 binds and inhibits, and the function of these host target genes, as elaborated

hereinbelow.

[30277] Nucleotide sequences of the VGAM2165 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2165 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2165 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2165 are further described hereinbelow with reference to Table 1.

[30278] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2165 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[30279] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2166 (VGAM2166) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[30280] VGAM2166 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene.

The method by which VGAM2166 was detected is described hereinabove with reference to Figs. 2-8.

[30281] VGAM2166 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Camelpox virus. VGAM2166 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[30282] VGAM2166 gene, herein designated VGAM GENE, encodes a VGAM2166 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2166 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2166 precursor RNA is designated SEQ ID:2152, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2152 is located at position 186373 relative to the genome of Camelpox virus.

[30283] VGAM2166 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2166 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typi-

cal of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[30284] An enzyme complex designated DICER COMPLEX, dices the VGAM2166 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2166 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM2166 RNA is designated SEQ ID:4877, and is provided hereinbelow with reference to the sequence listing part.

[30285] VGAM2166 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2166 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2166 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding

gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[30286] VGAM2166 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2166 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2166 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2166 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2166 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be lo-

cated in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[30287] The complementary binding of VGAM2166 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2166 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2166 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2166 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[30288] It is appreciated that VGAM2166 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2166 host target genes. The mRNA of each one of this plurality of VGAM2166 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2166 RNA, herein designated VGAM RNA, and which when bound by VGAM2166 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2166 host target proteins.

[30289] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with

specific reference to translational inhibition exerted by VGAM2166 gene, herein designated VGAM GENE, on one or more VGAM2166 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[30290] It is yet further appreciated that a function of VGAM2166 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2166 include diagnosis, prevention and treatment of viral infection by Camelpox virus. Specific functions, and accordingly utilities, of VGAM2166 correlate with, and may be deduced from, the identity of the host target genes which VGAM2166 binds and inhibits,

and the function of these host target genes, as elaborated hereinbelow.

[30291] Nucleotide sequences of the VGAM2166 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2166 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2166 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2166 are further described hereinbelow with reference to Table 1.

[30292] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2166 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[30293] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2167 (VGAM2167) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[30294] VGAM2167 is a novel bioinformatically detected regula-

tory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2167 was detected is described hereinabove with reference to Figs. 2-8.

[30295] VGAM2167 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Parsnip yellow fleck virus. VGAM2167 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[30296] VGAM2167 gene, herein designated VGAM GENE, encodes a VGAM2167 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2167 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2167 precursor RNA is designated SEQ ID:2153, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2153 is located at position 7389 relative to the genome of Parsnip yellow fleck virus.

[30297] VGAM2167 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2167 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure.

As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[30298] An enzyme complex designated DICER COMPLEX, dices the VGAM2167 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2167 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of VGAM2167 RNA is designated SEQ ID:4878, and is provided hereinbelow with reference to the sequence listing part.

[30299] VGAM2167 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2167 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2167 host target RNA, herein designated VGAM HOST TARGET RNA, comprises

three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[30300] VGAM2167 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2167 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2167 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2167 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2167 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an

example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[30301] The complementary binding of VGAM2167 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2167 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2167 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2167 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[30302] It is appreciated that VGAM2167 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2167 host target genes. The mRNA of each one of this plurality of VGAM2167 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2167 RNA, herein designated VGAM RNA, and which when bound by VGAM2167 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2167 host target proteins.

[30303] It is further appreciated by one skilled in the art that the

mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2167 gene, herein designated VGAM GENE, on one or more VGAM2167 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[30304] It is yet further appreciated that a function of VGAM2167 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2167 include diagnosis, prevention and treatment of viral infection by Parsnip yellow fleck virus. Specific functions, and accordingly utilities, of VGAM2167 correlate with, and may be deduced from, the identity of

the host target genes which VGAM2167 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[30305] Nucleotide sequences of the VGAM2167 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2167 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2167 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2167 are further described hereinbelow with reference to Table 1.

[30306] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2167 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[30307] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2168 (VGAM2168) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[30308] VGAM2168 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2168 was detected is described hereinabove with reference to Figs. 2-8.

[30309] VGAM2168 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Parsnip yellow fleck virus. VGAM2168 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[30310] VGAM2168 gene, herein designated VGAM GENE, encodes a VGAM2168 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2168 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2168 precursor RNA is designated SEQ ID:2154, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2154 is located at position 4305 relative to the genome of Parsnip yellow fleck virus.

[30311] VGAM2168 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2168 folded precursor RNA, herein designated VGAM FOLDED PRECUR-

SOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[30312] An enzyme complex designated DICER COMPLEX, dices the VGAM2168 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2168 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM2168 RNA is designated SEQ ID:4879, and is provided hereinbelow with reference to the sequence listing part.

[30313] VGAM2168 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2168 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2168 host target RNA,

herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[30314] VGAM2168 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2168 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2168 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2168 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2168 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host tar-

get binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[30315] The complementary binding of VGAM2168 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2168 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2168 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2168 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[30316] It is appreciated that VGAM2168 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2168 host target genes. The mRNA of each one of this plurality of VGAM2168 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2168 RNA, herein designated VGAM RNA, and which when bound by VGAM2168 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2168 host target proteins.

[30317] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2168 gene, herein designated VGAM GENE, on one or more VGAM2168 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[30318] It is yet further appreciated that a function of VGAM2168 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2168 include diagnosis, prevention and treatment of viral infection by Parsnip yellow fleck virus. Specific functions, and accordingly utilities, of VGAM2168

correlate with, and may be deduced from, the identity of the host target genes which VGAM2168 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[30319] Nucleotide sequences of the VGAM2168 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2168 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2168 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2168 are further described hereinbelow with reference to Table 1.

[30320] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2168 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[30321] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2169 (VGAM2169) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the

art.

[30322] VGAM2169 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2169 was detected is described hereinabove with reference to Figs. 2-8.

[30323] VGAM2169 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Camelpox virus. VGAM2169 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[30324] VGAM2169 gene, herein designated VGAM GENE, encodes a VGAM2169 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2169 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2169 precursor RNA is designated SEQ ID:2155, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2155 is located at position 183939 relative to the genome of Camelpox virus.

[30325] VGAM2169 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2169 folded

precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[30326] An enzyme complex designated DICER COMPLEX, dices the VGAM2169 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2169 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 51%) nucleotide sequence of VGAM2169 RNA is designated SEQ ID:4880, and is provided hereinbelow with reference to the sequence listing part.

[30327] VGAM2169 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2169 host target RNA, herein designated

VGAM HOST TARGET RNA. VGAM2169 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[30328] VGAM2169 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2169 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2169 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2169 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2169 host target RNA, herein designated VGAM HOST TARGET RNA.

It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[30329] The complementary binding of VGAM2169 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2169 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2169 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2169 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[30330] It is appreciated that VGAM2169 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2169 host target genes. The mRNA of each one of this plurality of VGAM2169 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2169 RNA, herein designated VGAM RNA, and which when bound by VGAM2169 RNA, herein designated VGAM RNA, causes inhibition of translation of

respective one or more VGAM2169 host target proteins.

[30331] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2169 gene, herein designated VGAM GENE, on one or more VGAM2169 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[30332] It is yet further appreciated that a function of VGAM2169 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2169 include diagnosis, prevention and treatment of viral infection by Camelpox virus. Specific

functions, and accordingly utilities, of VGAM2169 correlate with, and may be deduced from, the identity of the host target genes which VGAM2169 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[30333] Nucleotide sequences of the VGAM2169 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2169 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2169 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2169 are further described hereinbelow with reference to Table 1.

[30334] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2169 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[30335] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2170 (VGAM2170) viral gene, which modulates expression of respective host target genes thereof, the func-

tion and utility of which host target genes is known in the art.

[30336] VGAM2170 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2170 was detected is described hereinabove with reference to Figs. 2-8.

[30337] VGAM2170 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Parsnip yellow fleck virus. VGAM2170 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[30338] VGAM2170 gene, herein designated VGAM GENE, encodes a VGAM2170 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2170 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2170 precursor RNA is designated SEQ ID:2156, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2156 is located at position 8639 relative to the genome of Parsnip yellow fleck virus.

[30339] VGAM2170 precursor RNA, herein designated VGAM PRE-

CURSOR RNA, folds onto itself, forming VGAM2170 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[30340] An enzyme complex designated DICER COMPLEX, dices the VGAM2170 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2170 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 46%) nucleotide sequence of VGAM2170 RNA is designated SEQ ID:4881, and is provided hereinbelow with reference to the sequence listing part.

[30341] VGAM2170 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger

RNA, VGAM2170 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2170 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[30342] VGAM2170 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2170 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2170 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2170 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2170 host

target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[30343] The complementary binding of VGAM2170 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2170 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2170 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2170 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[30344] It is appreciated that VGAM2170 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2170 host target genes. The mRNA of each one of this plurality of VGAM2170 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2170 RNA, herein designated VGAM RNA, and which when bound by VGAM2170 RNA, herein

designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2170 host target proteins.

[30345] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2170 gene, herein designated VGAM GENE, on one or more VGAM2170 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[30346] It is yet further appreciated that a function of VGAM2170 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2170 include diagnosis, prevention and

treatment of viral infection by Parsnip yellow fleck virus. Specific functions, and accordingly utilities, of VGAM2170 correlate with, and may be deduced from, the identity of the host target genes which VGAM2170 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[30347] Nucleotide sequences of the VGAM2170 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2170 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2170 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2170 are further described hereinbelow with reference to Table 1.

[30348] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2170 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[30349] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2171 (VGAM2171) viral gene, which modulates ex-

pression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[30350] VGAM2171 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2171 was detected is described hereinabove with reference to Figs. 2-8.

[30351] VGAM2171 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Parsnip yellow fleck virus. VGAM2171 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[30352] VGAM2171 gene, herein designated VGAM GENE, encodes a VGAM2171 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2171 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2171 precursor RNA is designated SEQ ID:2157, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2157 is located at position 5077 relative to the genome of Parsnip yellow fleck virus.

[30353] VGAM2171 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2171 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[30354] An enzyme complex designated DICER COMPLEX, dices the VGAM2171 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2171 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 46%) nucleotide sequence of VGAM2171 RNA is designated SEQ ID:4882, and is provided hereinbelow with reference to the sequence listing part.

[30355] VGAM2171 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2171 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2171 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[30356] VGAM2171 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2171 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2171 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2171 RNA, herein designated VGAM RNA, may have a different number of host target

binding sites in untranslated regions of a VGAM2171 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[30357] The complementary binding of VGAM2171 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2171 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2171 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2171 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[30358] It is appreciated that VGAM2171 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2171 host target genes. The mRNA of each one of this plurality of VGAM2171 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2171 RNA, herein designated VGAM

RNA, and which when bound by VGAM2171 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2171 host target proteins.

[30359] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2171 gene, herein designated VGAM GENE, on one or more VGAM2171 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[30360] It is yet further appreciated that a function of VGAM2171 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly,

utilities of VGAM2171 include diagnosis, prevention and treatment of viral infection by Parsnip yellow fleck virus. Specific functions, and accordingly utilities, of VGAM2171 correlate with, and may be deduced from, the identity of the host target genes which VGAM2171 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[30361] Nucleotide sequences of the VGAM2171 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2171 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2171 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2171 are further described hereinbelow with reference to Table 1.

[30362] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2171 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[30363] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Mes-

senger 2172 (VGAM2172) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[30364] VGAM2172 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2172 was detected is described hereinabove with reference to Figs. 2-8.

[30365] VGAM2172 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Parsnip yellow fleck virus. VGAM2172 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[30366] VGAM2172 gene, herein designated VGAM GENE, encodes a VGAM2172 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2172 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2172 precursor RNA is designated SEQ ID:2158, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2158 is located at position 578

relative to the genome of Parsnip yellow fleck virus.

[30367] VGAM2172 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2172 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[30368] An enzyme complex designated DICER COMPLEX, dices the VGAM2172 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2172 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 63%) nucleotide sequence of VGAM2172 RNA is designated SEQ ID:4883, and is provided hereinbelow with reference to the sequence listing part.

[30369] VGAM2172 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2172 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2172 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[30370] VGAM2172 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2172 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2172 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2172 RNA, herein designated

VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2172 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[30371] The complementary binding of VGAM2172 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2172 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2172 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2172 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[30372] It is appreciated that VGAM2172 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2172 host target genes. The mRNA of each one of this plurality of VGAM2172 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly com-

plementary to VGAM2172 RNA, herein designated VGAM RNA, and which when bound by VGAM2172 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2172 host target proteins.

[30373] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2172 gene, herein designated VGAM GENE, on one or more VGAM2172 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[30374] It is yet further appreciated that a function of VGAM2172 is inhibition of expression of host target genes, as part of

a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2172 include diagnosis, prevention and treatment of viral infection by Parsnip yellow fleck virus. Specific functions, and accordingly utilities, of VGAM2172 correlate with, and may be deduced from, the identity of the host target genes which VGAM2172 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[30375] Nucleotide sequences of the VGAM2172 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2172 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2172 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2172 are further described hereinbelow with reference to Table 1.

[30376] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2172 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[30377] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present

invention, referred to here as Viral Genomic Address Messenger 2173 (VGAM2173) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[30378] VGAM2173 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2173 was detected is described hereinabove with reference to Figs. 2-8.

[30379] VGAM2173 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Parsnip yellow fleck virus. VGAM2173 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[30380] VGAM2173 gene, herein designated VGAM GENE, encodes a VGAM2173 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2173 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2173 precursor RNA is designated SEQ ID:2159, and is provided hereinbelow with reference to the sequence listing part. Nu-

cleotide sequence SEQ ID:2159 is located at position 3661 relative to the genome of Parsnip yellow fleck virus.

[30381] VGAM2173 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2173 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[30382] An enzyme complex designated DICER COMPLEX, dices the VGAM2173 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2173 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 74%) nucleotide sequence of VGAM2173 RNA is designated SEQ ID:4884, and is provided hereinbelow with reference to the sequence

listing part.

[30383] VGAM2173 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2173 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2173 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[30384] VGAM2173 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2173 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2173 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not

meant to be limiting VGAM2173 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2173 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[30385] The complementary binding of VGAM2173 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2173 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2173 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2173 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[30386] It is appreciated that VGAM2173 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2173 host target genes. The mRNA of each one of this plurality of VGAM2173 host target genes comprises one or more host target binding sites, each

having a nucleotide sequence which is at least partly complementary to VGAM2173 RNA, herein designated VGAM RNA, and which when bound by VGAM2173 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2173 host target proteins.

[30387] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2173 gene, herein designated VGAM GENE, on one or more VGAM2173 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[30388] It is yet further appreciated that a function of VGAM2173

is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2173 include diagnosis, prevention and treatment of viral infection by Parsnip yellow fleck virus. Specific functions, and accordingly utilities, of VGAM2173 correlate with, and may be deduced from, the identity of the host target genes which VGAM2173 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[30389] Nucleotide sequences of the VGAM2173 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2173 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2173 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2173 are further described hereinbelow with reference to Table 1.

[30390] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2173 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[30391] Fig. 1 further provides a conceptual description of another

novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2174 (VGAM2174) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[30392] VGAM2174 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2174 was detected is described hereinabove with reference to Figs. 2-8.

[30393] VGAM2174 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rabbit fibroma virus. VGAM2174 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[30394] VGAM2174 gene, herein designated VGAM GENE, encodes a VGAM2174 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2174 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2174 precursor RNA is designated SEQ ID:2160, and is provided here-

inbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2160 is located at position 17511 relative to the genome of Rabbit fibroma virus.

[30395] VGAM2174 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2174 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[30396] An enzyme complex designated DICER COMPLEX, dices the VGAM2174 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2174 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 60%) nucleotide sequence of VGAM2174 RNA is designated SEQ ID:4885, and

is provided hereinbelow with reference to the sequence listing part.

[30397] VGAM2174 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2174 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2174 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[30398] VGAM2174 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2174 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2174 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites

shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2174 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2174 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[30399] The complementary binding of VGAM2174 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2174 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2174 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2174 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[30400] It is appreciated that VGAM2174 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2174 host target genes. The mRNA of each one of this plurality of VGAM2174 host target genes

comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2174 RNA, herein designated VGAM RNA, and which when bound by VGAM2174 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2174 host target proteins.

[30401] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2174 gene, herein designated VGAM GENE, on one or more VGAM2174 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[30402] It is yet further appreciated that a function of VGAM2174 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2174 include diagnosis, prevention and treatment of viral infection by Rabbit fibroma virus. Specific functions, and accordingly utilities, of VGAM2174 correlate with, and may be deduced from, the identity of the host target genes which VGAM2174 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[30403] Nucleotide sequences of the VGAM2174 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2174 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2174 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2174 are further described hereinbelow with reference to Table 1.

[30404] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2174 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[30405] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2175 (VGAM2175) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[30406] VGAM2175 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2175 was detected is described hereinabove with reference to Figs. 2-8.

[30407] VGAM2175 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rabbit fibroma virus. VGAM2175 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[30408] VGAM2175 gene, herein designated VGAM GENE, encodes a VGAM2175 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2175 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2175 precur-

sor RNA is designated SEQ ID:2161, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2161 is located at position 10893 relative to the genome of Rabbit fibroma virus.

[30409] VGAM2175 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2175 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[30410] An enzyme complex designated DICER COMPLEX, dices the VGAM2175 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2175 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 68%) nucleotide se-

quence of VGAM2175 RNA is designated SEQ ID:4886, and is provided hereinbelow with reference to the sequence listing part.

[30411] VGAM2175 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2175 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2175 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[30412] VGAM2175 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2175 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2175 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is ap-

preciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2175 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2175 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[30413] The complementary binding of VGAM2175 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2175 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2175 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2175 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[30414] It is appreciated that VGAM2175 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2175 host target genes. The mRNA of

each one of this plurality of VGAM2175 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2175 RNA, herein designated VGAM RNA, and which when bound by VGAM2175 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2175 host target proteins.

[30415] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2175 gene, herein designated VGAM GENE, on one or more VGAM2175 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science

294,779 (2001)).

[30416] It is yet further appreciated that a function of VGAM2175 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2175 include diagnosis, prevention and treatment of viral infection by Rabbit fibroma virus. Specific functions, and accordingly utilities, of VGAM2175 correlate with, and may be deduced from, the identity of the host target genes which VGAM2175 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[30417] Nucleotide sequences of the VGAM2175 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2175 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2175 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2175 are further described hereinbelow with reference to Table 1.

[30418] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2175 RNA, herein designated VGAM RNA, are de-

scribed hereinbelow with reference to Table 2.

[30419] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2176 (VGAM2176) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[30420] VGAM2176 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2176 was detected is described hereinabove with reference to Figs. 2-8.

[30421] VGAM2176 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rabbit fibroma virus. VGAM2176 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[30422] VGAM2176 gene, herein designated VGAM GENE, encodes a VGAM2176 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2176 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly

similar to the nucleotide sequence of VGAM2176 precursor RNA is designated SEQ ID:2162, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2162 is located at position 10073 relative to the genome of Rabbit fibroma virus.

[30423] VGAM2176 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2176 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[30424] An enzyme complex designated DICER COMPLEX, dices the VGAM2176 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2176 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other

necessary proteins. A probable (over 51%) nucleotide sequence of VGAM2176 RNA is designated SEQ ID:4887, and is provided hereinbelow with reference to the sequence listing part.

[30425] VGAM2176 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2176 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2176 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[30426] VGAM2176 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2176 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2176 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I,

BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2176 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2176 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[30427] The complementary binding of VGAM2176 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2176 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2176 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2176 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[30428] It is appreciated that VGAM2176 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents

a plurality of VGAM2176 host target genes. The mRNA of each one of this plurality of VGAM2176 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2176 RNA, herein designated VGAM RNA, and which when bound by VGAM2176 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2176 host target proteins.

[30429] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2176 gene, herein designated VGAM GENE, on one or more VGAM2176 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[30430] It is yet further appreciated that a function of VGAM2176 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2176 include diagnosis, prevention and treatment of viral infection by Rabbit fibroma virus. Specific functions, and accordingly utilities, of VGAM2176 correlate with, and may be deduced from, the identity of the host target genes which VGAM2176 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[30431] Nucleotide sequences of the VGAM2176 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2176 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2176 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2176 are further described hereinbelow with reference to Table 1.

[30432] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites

to VGAM2176 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[30433] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2177 (VGAM2177) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[30434] VGAM2177 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2177 was detected is described hereinabove with reference to Figs. 2-8.

[30435] VGAM2177 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rabbit fibroma virus. VGAM2177 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[30436] VGAM2177 gene, herein designated VGAM GENE, encodes a VGAM2177 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2177 precursor RNA, herein designated VGAM PRECURSOR RNA, does not en-

code a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2177 precursor RNA is designated SEQ ID:2163, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2163 is located at position 14151 relative to the genome of Rabbit fibroma virus.

[30437] VGAM2177 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2177 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[30438] An enzyme complex designated DICER COMPLEX, dices the VGAM2177 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2177 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer together with other necessary proteins. A probable (over 52%) nucleotide sequence of VGAM2177 RNA is designated SEQ ID:4888, and is provided hereinbelow with reference to the sequence listing part.

[30439] VGAM2177 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2177 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2177 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[30440] VGAM2177 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2177 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2177 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3

such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2177 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2177 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[30441] The complementary binding of VGAM2177 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2177 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2177 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2177 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[30442] It is appreciated that VGAM2177 host target gene, herein

designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2177 host target genes. The mRNA of each one of this plurality of VGAM2177 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2177 RNA, herein designated VGAM RNA, and which when bound by VGAM2177 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2177 host target proteins.

[30443] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2177 gene, herein designated VGAM GENE, on one or more VGAM2177 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these

other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[30444] It is yet further appreciated that a function of VGAM2177 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2177 include diagnosis, prevention and treatment of viral infection by Rabbit fibroma virus. Specific functions, and accordingly utilities, of VGAM2177 correlate with, and may be deduced from, the identity of the host target genes which VGAM2177 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[30445] Nucleotide sequences of the VGAM2177 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2177 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2177 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2177 are further described hereinbelow with reference to Table 1.

[30446] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the

complementarity of each of these host target binding sites to VGAM2177 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[30447] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2178 (VGAM2178) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[30448] VGAM2178 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2178 was detected is described hereinabove with reference to Figs. 2-8.

[30449] VGAM2178 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rabbit fibroma virus. VGAM2178 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[30450] VGAM2178 gene, herein designated VGAM GENE, encodes a VGAM2178 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2178 precursor RNA,

herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2178 precursor RNA is designated SEQ ID:2164, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2164 is located at position 22881 relative to the genome of Rabbit fibroma virus.

[30451] VGAM2178 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2178 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[30452] An enzyme complex designated DICER COMPLEX, dices the VGAM2178 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2178 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short

~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM2178 RNA is designated SEQ ID:4889, and is provided hereinbelow with reference to the sequence listing part.

[30453] VGAM2178 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2178 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2178 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[30454] VGAM2178 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2178 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2178 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host

target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2178 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2178 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[30455] The complementary binding of VGAM2178 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2178 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2178 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2178 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[30456] It is appreciated that VGAM2178 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2178 host target genes. The mRNA of each one of this plurality of VGAM2178 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2178 RNA, herein designated VGAM RNA, and which when bound by VGAM2178 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2178 host target proteins.

[30457] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2178 gene, herein designated VGAM GENE, on one or more VGAM2178 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, al-

though specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[30458] It is yet further appreciated that a function of VGAM2178 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2178 include diagnosis, prevention and treatment of viral infection by Rabbit fibroma virus. Specific functions, and accordingly utilities, of VGAM2178 correlate with, and may be deduced from, the identity of the host target genes which VGAM2178 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[30459] Nucleotide sequences of the VGAM2178 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2178 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2178 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2178 are further described hereinbelow with reference to Table 1.

[30460] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of

Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2178 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[30461] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2179 (VGAM2179) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[30462] VGAM2179 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2179 was detected is described hereinabove with reference to Figs. 2-8.

[30463] VGAM2179 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rabbit fibroma virus. VGAM2179 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[30464] VGAM2179 gene, herein designated VGAM GENE, encodes a VGAM2179 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and un-

like most ordinary genes, VGAM2179 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2179 precursor RNA is designated SEQ ID:2165, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2165 is located at position 15205 relative to the genome of Rabbit fibroma virus.

[30465] VGAM2179 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2179 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[30466] An enzyme complex designated DICER COMPLEX, dices the VGAM2179 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2179 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a

hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM2179 RNA is designated SEQ ID:4890, and is provided hereinbelow with reference to the sequence listing part.

[30467] VGAM2179 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2179 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2179 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[30468] VGAM2179 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2179 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2179 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed

sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2179 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2179 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[30469] The complementary binding of VGAM2179 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2179 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2179 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2179 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target

protein is therefore outlined by a broken line.

[30470] It is appreciated that VGAM2179 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2179 host target genes. The mRNA of each one of this plurality of VGAM2179 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2179 RNA, herein designated VGAM RNA, and which when bound by VGAM2179 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2179 host target proteins.

[30471] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2179 gene, herein designated VGAM GENE, on one or more VGAM2179 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate ex-

pression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[30472] It is yet further appreciated that a function of VGAM2179 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2179 include diagnosis, prevention and treatment of viral infection by Rabbit fibroma virus. Specific functions, and accordingly utilities, of VGAM2179 correlate with, and may be deduced from, the identity of the host target genes which VGAM2179 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[30473] Nucleotide sequences of the VGAM2179 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2179 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2179 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2179 are further described hereinbelow with reference to Table 1.

[30474] Nucleotide sequences of host target binding sites, such as

BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2179 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[30475] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2180 (VGAM2180) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[30476] VGAM2180 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2180 was detected is described hereinabove with reference to Figs. 2-8.

[30477] VGAM2180 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Yaba-like disease virus. VGAM2180 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[30478] VGAM2180 gene, herein designated VGAM GENE, encodes a VGAM2180 precursor RNA, herein designated VGAM

PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2180 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2180 precursor RNA is designated SEQ ID:2166, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2166 is located at position 128284 relative to the genome of Yaba-like disease virus.

[30479] VGAM2180 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2180 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[30480] An enzyme complex designated DICER COMPLEX, dices the VGAM2180 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2180 RNA, herein designated VGAM RNA, a single stranded ~22 nt

long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 44%) nucleotide sequence of VGAM2180 RNA is designated SEQ ID:4891, and is provided hereinbelow with reference to the sequence listing part.

[30481] VGAM2180 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2180 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2180 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[30482] VGAM2180 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2180 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2180 RNA, herein designated

VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2180 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2180 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[30483] The complementary binding of VGAM2180 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2180 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2180 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2180 host target protein, herein desig-

nated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[30484] It is appreciated that VGAM2180 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2180 host target genes. The mRNA of each one of this plurality of VGAM2180 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2180 RNA, herein designated VGAM RNA, and which when bound by VGAM2180 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2180 host target proteins.

[30485] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2180 gene, herein designated VGAM GENE, on one or more VGAM2180 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are

also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[30486] It is yet further appreciated that a function of VGAM2180 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2180 include diagnosis, prevention and treatment of viral infection by Yaba-like disease virus. Specific functions, and accordingly utilities, of VGAM2180 correlate with, and may be deduced from, the identity of the host target genes which VGAM2180 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[30487] Nucleotide sequences of the VGAM2180 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2180 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2180 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2180 are further described hereinbelow with reference to Table 1.

[30488] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2180 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[30489] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2181 (VGAM2181) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[30490] VGAM2181 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2181 was detected is described hereinabove with reference to Figs. 2-8.

[30491] VGAM2181 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Yaba-like disease virus. VGAM2181 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[30492] VGAM2181 gene, herein designated VGAM GENE, encodes

a VGAM2181 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2181 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2181 precursor RNA is designated SEQ ID:2167, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2167 is located at position 125843 relative to the genome of Yaba-like disease virus.

[30493] VGAM2181 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2181 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[30494] An enzyme complex designated DICER COMPLEX, dices the VGAM2181 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2181 RNA,

herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 75%) nucleotide sequence of VGAM2181 RNA is designated SEQ ID:4892, and is provided hereinbelow with reference to the sequence listing part.

[30495] VGAM2181 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2181 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2181 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[30496] VGAM2181 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2181 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nu-

cleotide sequence of VGAM2181 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2181 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2181 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[30497] The complementary binding of VGAM2181 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2181 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2181 host target RNA, herein designated VGAM HOST TARGET

RNA, into VGAM2181 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[30498] It is appreciated that VGAM2181 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2181 host target genes. The mRNA of each one of this plurality of VGAM2181 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2181 RNA, herein designated VGAM RNA, and which when bound by VGAM2181 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2181 host target proteins.

[30499] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2181 gene, herein designated VGAM GENE, on one or more VGAM2181 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4

and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[30500] It is yet further appreciated that a function of VGAM2181 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2181 include diagnosis, prevention and treatment of viral infection by Yaba-like disease virus. Specific functions, and accordingly utilities, of VGAM2181 correlate with, and may be deduced from, the identity of the host target genes which VGAM2181 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[30501] Nucleotide sequences of the VGAM2181 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2181 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2181 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2181 are further

described hereinbelow with reference to Table 1.

[30502] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2181 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[30503] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2182 (VGAM2182) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[30504] VGAM2182 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2182 was detected is described hereinabove with reference to Figs. 2-8.

[30505] VGAM2182 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Yaba-like disease virus. VGAM2182 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[30506] VGAM2182 gene, herein designated VGAM GENE, encodes a VGAM2182 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2182 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2182 precursor RNA is designated SEQ ID:2168, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2168 is located at position 132254 relative to the genome of Yaba-like disease virus.

[30507] VGAM2182 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2182 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[30508] An enzyme complex designated DICER COMPLEX, dices the VGAM2182 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, into VGAM2182 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM2182 RNA is designated SEQ ID:4893, and is provided hereinbelow with reference to the sequence listing part.

[30509] VGAM2182 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2182 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2182 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[30510] VGAM2182 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2182 host target RNA, herein designated VGAM HOST TARGET RNA. This

complementary binding is due to the fact that the nucleotide sequence of VGAM2182 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2182 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2182 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[30511] The complementary binding of VGAM2182 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2182 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2182

host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2182 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[30512] It is appreciated that VGAM2182 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2182 host target genes. The mRNA of each one of this plurality of VGAM2182 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2182 RNA, herein designated VGAM RNA, and which when bound by VGAM2182 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2182 host target proteins.

[30513] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2182 gene, herein designated VGAM GENE, on one or more VGAM2182 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated

only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[30514] It is yet further appreciated that a function of VGAM2182 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2182 include diagnosis, prevention and treatment of viral infection by Yaba-like disease virus. Specific functions, and accordingly utilities, of VGAM2182 correlate with, and may be deduced from, the identity of the host target genes which VGAM2182 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[30515] Nucleotide sequences of the VGAM2182 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2182 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2182 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, of VGAM2182 are further described hereinbelow with reference to Table 1.

[30516] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2182 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[30517] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2183 (VGAM2183) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[30518] VGAM2183 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2183 was detected is described hereinabove with reference to Figs. 2-8.

[30519] VGAM2183 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Yaba-like disease virus. VGAM2183 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the

human genome.

[30520] VGAM2183 gene, herein designated VGAM GENE, encodes a VGAM2183 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2183 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2183 precursor RNA is designated SEQ ID:2169, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2169 is located at position 135497 relative to the genome of Yaba-like disease virus.

[30521] VGAM2183 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2183 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[30522] An enzyme complex designated DICER COMPLEX, dices

the VGAM2183 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2183 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM2183 RNA is designated SEQ ID:4894, and is provided hereinbelow with reference to the sequence listing part.

[30523] VGAM2183 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2183 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2183 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[30524] VGAM2183 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2183 host target

RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2183 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2183 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2183 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[30525] The complementary binding of VGAM2183 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2183 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE

II and BINDING SITE III, inhibits translation of VGAM2183 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2183 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[30526] It is appreciated that VGAM2183 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2183 host target genes. The mRNA of each one of this plurality of VGAM2183 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2183 RNA, herein designated VGAM RNA, and which when bound by VGAM2183 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2183 host target proteins.

[30527] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2183 gene, herein designated VGAM GENE, on one or more VGAM2183 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a spe-

cific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[30528] It is yet further appreciated that a function of VGAM2183 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2183 include diagnosis, prevention and treatment of viral infection by Yaba-like disease virus. Specific functions, and accordingly utilities, of VGAM2183 correlate with, and may be deduced from, the identity of the host target genes which VGAM2183 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[30529] Nucleotide sequences of the VGAM2183 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2183 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of

VGAM2183 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2183 are further described hereinbelow with reference to Table 1.

[30530] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2183 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[30531] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2184 (VGAM2184) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[30532] VGAM2184 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2184 was detected is described hereinabove with reference to Figs. 2-8.

[30533] VGAM2184 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Monkeypox virus. VGAM2184 host target gene, herein designated VGAM

HOST TARGET GENE, is a human gene contained in the human genome.

[30534] VGAM2184 gene, herein designated VGAM GENE, encodes a VGAM2184 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2184 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2184 precursor RNA is designated SEQ ID:2170, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2170 is located at position 187541 relative to the genome of Monkeypox virus.

[30535] VGAM2184 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2184 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[30536] An enzyme complex designated DICER COMPLEX, dices the VGAM2184 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2184 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM2184 RNA is designated SEQ ID:4895, and is provided hereinbelow with reference to the sequence listing part.

[30537] VGAM2184 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2184 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2184 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[30538] VGAM2184 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites

located in untranslated regions of VGAM2184 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2184 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2184 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2184 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[30539] The complementary binding of VGAM2184 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2184 host target RNA, herein designated VGAM

HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2184 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2184 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[30540] It is appreciated that VGAM2184 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2184 host target genes. The mRNA of each one of this plurality of VGAM2184 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2184 RNA, herein designated VGAM RNA, and which when bound by VGAM2184 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2184 host target proteins.

[30541] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2184 gene, herein designated VGAM GENE, on one or more VGAM2184 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove

with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[30542] It is yet further appreciated that a function of VGAM2184 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2184 include diagnosis, prevention and treatment of viral infection by Monkeypox virus. Specific functions, and accordingly utilities, of VGAM2184 correlate with, and may be deduced from, the identity of the host target genes which VGAM2184 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[30543] Nucleotide sequences of the VGAM2184 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2184 RNA, herein designated VGAM RNA, and

a schematic representation of the secondary folding of VGAM2184 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2184 are further described hereinbelow with reference to Table 1.

[30544] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2184 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[30545] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2185 (VGAM2185) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[30546] VGAM2185 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2185 was detected is described hereinabove with reference to Figs. 2-8.

[30547] VGAM2185 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Camelpox virus.

VGAM2185 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[30548] VGAM2185 gene, herein designated VGAM GENE, encodes a VGAM2185 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2185 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2185 precursor RNA is designated SEQ ID:2171, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2171 is located at position 195252 relative to the genome of Camelpox virus.

[30549] VGAM2185 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2185 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of

the second half thereof.

[30550] An enzyme complex designated DICER COMPLEX, dices the VGAM2185 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2185 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 52%) nucleotide sequence of VGAM2185 RNA is designated SEQ ID:4896, and is provided hereinbelow with reference to the sequence listing part.

[30551] VGAM2185 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2185 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2185 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[30552] VGAM2185 RNA, herein designated VGAM RNA, binds

complementarily to one or more host target binding sites located in untranslated regions of VGAM2185 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2185 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2185 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2185 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[30553] The complementary binding of VGAM2185 RNA, herein designated VGAM RNA, to host target binding sites on

VGAM2185 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2185 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2185 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[30554] It is appreciated that VGAM2185 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2185 host target genes. The mRNA of each one of this plurality of VGAM2185 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2185 RNA, herein designated VGAM RNA, and which when bound by VGAM2185 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2185 host target proteins.

[30555] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2185 gene, herein designated VGAM GENE, on one or more VGAM2185 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other

known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[30556] It is yet further appreciated that a function of VGAM2185 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2185 include diagnosis, prevention and treatment of viral infection by Camelpox virus. Specific functions, and accordingly utilities, of VGAM2185 correlate with, and may be deduced from, the identity of the host target genes which VGAM2185 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[30557] Nucleotide sequences of the VGAM2185 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the

diced VGAM2185 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2185 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2185 are further described hereinbelow with reference to Table 1.

[30558] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2185 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[30559] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2186 (VGAM2186) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[30560] VGAM2186 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2186 was detected is described hereinabove with reference to Figs. 2-8.

[30561] VGAM2186 gene, herein designated VGAM GENE, is a viral

gene contained in the genome of Monkeypox virus. VGAM2186 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[30562] VGAM2186 gene, herein designated VGAM GENE, encodes a VGAM2186 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2186 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2186 precursor RNA is designated SEQ ID:2172, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2172 is located at position 184211 relative to the genome of Monkeypox virus.

[30563] VGAM2186 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2186 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial

inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[30564] An enzyme complex designated DICER COMPLEX, dices the VGAM2186 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2186 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 65%) nucleotide sequence of VGAM2186 RNA is designated SEQ ID:4897, and is provided hereinbelow with reference to the sequence listing part.

[30565] VGAM2186 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2186 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2186 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[30566] VGAM2186 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2186 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2186 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2186 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2186 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[30567] The complementary binding of VGAM2186 RNA, herein

designated VGAM RNA, to host target binding sites on VGAM2186 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2186 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2186 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[30568] It is appreciated that VGAM2186 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2186 host target genes. The mRNA of each one of this plurality of VGAM2186 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2186 RNA, herein designated VGAM RNA, and which when bound by VGAM2186 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2186 host target proteins.

[30569] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2186 gene, herein designated VGAM GENE, on one or more VGAM2186 host target gene, herein designated

VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[30570] It is yet further appreciated that a function of VGAM2186 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2186 include diagnosis, prevention and treatment of viral infection by Monkeypox virus. Specific functions, and accordingly utilities, of VGAM2186 correlate with, and may be deduced from, the identity of the host target genes which VGAM2186 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[30571] Nucleotide sequences of the VGAM2186 precursor RNA,

herein designated VGAM PRECURSOR RNA, and of the diced VGAM2186 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2186 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2186 are further described hereinbelow with reference to Table 1.

[30572] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2186 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[30573] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2187 (VGAM2187) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[30574] VGAM2187 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2187 was detected is described hereinabove with reference to Figs. 2-8.

[30575] VGAM2187 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Monkeypox virus. VGAM2187 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[30576] VGAM2187 gene, herein designated VGAM GENE, encodes a VGAM2187 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2187 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2187 precursor RNA is designated SEQ ID:2173, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2173 is located at position 186422 relative to the genome of Monkeypox virus.

[30577] VGAM2187 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2187 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the

RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[30578] An enzyme complex designated DICER COMPLEX, dices the VGAM2187 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2187 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM2187 RNA is designated SEQ ID:4898, and is provided hereinbelow with reference to the sequence listing part.

[30579] VGAM2187 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2187 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2187 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN COD-

ING and 3UTR respectively.

[30580] VGAM2187 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2187 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2187 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2187 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2187 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[30581] The complementary binding of VGAM2187 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2187 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2187 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2187 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[30582] It is appreciated that VGAM2187 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2187 host target genes. The mRNA of each one of this plurality of VGAM2187 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2187 RNA, herein designated VGAM RNA, and which when bound by VGAM2187 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2187 host target proteins.

[30583] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2187 gene, herein designated VGAM GENE, on one

or more VGAM2187 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[30584] It is yet further appreciated that a function of VGAM2187 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2187 include diagnosis, prevention and treatment of viral infection by Monkeypox virus. Specific functions, and accordingly utilities, of VGAM2187 correlate with, and may be deduced from, the identity of the host target genes which VGAM2187 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[30585] Nucleotide sequences of the VGAM2187 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2187 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2187 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2187 are further described hereinbelow with reference to Table 1.

[30586] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2187 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[30587] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2188 (VGAM2188) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[30588] VGAM2188 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2188 was detected is de-

scribed hereinabove with reference to Figs. 2-8.

[30589] VGAM2188 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Monkeypox virus. VGAM2188 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[30590] VGAM2188 gene, herein designated VGAM GENE, encodes a VGAM2188 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2188 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2188 precursor RNA is designated SEQ ID:2174, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2174 is located at position 185906 relative to the genome of Monkeypox virus.

[30591] VGAM2188 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2188 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the

RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[30592] An enzyme complex designated DICER COMPLEX, dices the VGAM2188 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2188 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide sequence of VGAM2188 RNA is designated SEQ ID:4899, and is provided hereinbelow with reference to the sequence listing part.

[30593] VGAM2188 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2188 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2188 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN COD-

ING and 3UTR respectively.

[30594] VGAM2188 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2188 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2188 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2188 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2188 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[30595] The complementary binding of VGAM2188 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2188 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2188 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2188 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[30596] It is appreciated that VGAM2188 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2188 host target genes. The mRNA of each one of this plurality of VGAM2188 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2188 RNA, herein designated VGAM RNA, and which when bound by VGAM2188 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2188 host target proteins.

[30597] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2188 gene, herein designated VGAM GENE, on one

or more VGAM2188 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[30598] It is yet further appreciated that a function of VGAM2188 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2188 include diagnosis, prevention and treatment of viral infection by Monkeypox virus. Specific functions, and accordingly utilities, of VGAM2188 correlate with, and may be deduced from, the identity of the host target genes which VGAM2188 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[30599] Nucleotide sequences of the VGAM2188 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2188 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2188 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2188 are further described hereinbelow with reference to Table 1.

[30600] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2188 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[30601] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2189 (VGAM2189) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[30602] VGAM2189 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2189 was detected is de-

scribed hereinabove with reference to Figs. 2-8.

[30603] VGAM2189 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Monkeypox virus. VGAM2189 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[30604] VGAM2189 gene, herein designated VGAM GENE, encodes a VGAM2189 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2189 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2189 precursor RNA is designated SEQ ID:2175, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2175 is located at position 189835 relative to the genome of Monkeypox virus.

[30605] VGAM2189 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2189 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the

fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[30606] An enzyme complex designated DICER COMPLEX, dices the VGAM2189 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2189 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM2189 RNA is designated SEQ ID:4900, and is provided hereinbelow with reference to the sequence listing part.

[30607] VGAM2189 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2189 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2189 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and

a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[30608] VGAM2189 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2189 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2189 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2189 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2189 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both

3UTR and 5UTR regions.

[30609] The complementary binding of VGAM2189 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2189 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2189 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2189 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[30610] It is appreciated that VGAM2189 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2189 host target genes. The mRNA of each one of this plurality of VGAM2189 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2189 RNA, herein designated VGAM RNA, and which when bound by VGAM2189 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2189 host target proteins.

[30611] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by

VGAM2189 gene, herein designated VGAM GENE, on one or more VGAM2189 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[30612] It is yet further appreciated that a function of VGAM2189 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2189 include diagnosis, prevention and treatment of viral infection by Monkeypox virus. Specific functions, and accordingly utilities, of VGAM2189 correlate with, and may be deduced from, the identity of the host target genes which VGAM2189 binds and inhibits, and the function of these host target genes, as elaborated

hereinbelow.

[30613] Nucleotide sequences of the VGAM2189 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2189 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2189 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2189 are further described hereinbelow with reference to Table 1.

[30614] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2189 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[30615] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2190 (VGAM2190) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[30616] VGAM2190 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene.

The method by which VGAM2190 was detected is described hereinabove with reference to Figs. 2-8.

[30617] VGAM2190 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Monkeypox virus. VGAM2190 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[30618] VGAM2190 gene, herein designated VGAM GENE, encodes a VGAM2190 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2190 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2190 precursor RNA is designated SEQ ID:2176, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2176 is located at position 181733 relative to the genome of Monkeypox virus.

[30619] VGAM2190 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2190 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typi-

cal of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[30620] An enzyme complex designated DICER COMPLEX, dices the VGAM2190 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2190 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM2190 RNA is designated SEQ ID:4901, and is provided hereinbelow with reference to the sequence listing part.

[30621] VGAM2190 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2190 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2190 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding

gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[30622] VGAM2190 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2190 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2190 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2190 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2190 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be lo-

cated in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[30623] The complementary binding of VGAM2190 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2190 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2190 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2190 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[30624] It is appreciated that VGAM2190 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2190 host target genes. The mRNA of each one of this plurality of VGAM2190 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2190 RNA, herein designated VGAM RNA, and which when bound by VGAM2190 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2190 host target proteins.

[30625] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with

specific reference to translational inhibition exerted by VGAM2190 gene, herein designated VGAM GENE, on one or more VGAM2190 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[30626] It is yet further appreciated that a function of VGAM2190 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2190 include diagnosis, prevention and treatment of viral infection by Monkeypox virus. Specific functions, and accordingly utilities, of VGAM2190 correlate with, and may be deduced from, the identity of the host target genes which VGAM2190 binds and inhibits,

and the function of these host target genes, as elaborated hereinbelow.

[30627] Nucleotide sequences of the VGAM2190 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2190 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2190 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2190 are further described hereinbelow with reference to Table 1.

[30628] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2190 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[30629] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2191 (VGAM2191) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[30630] VGAM2191 is a novel bioinformatically detected regula-

tory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2191 was detected is described hereinabove with reference to Figs. 2-8.

[30631] VGAM2191 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Monkeypox virus. VGAM2191 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[30632] VGAM2191 gene, herein designated VGAM GENE, encodes a VGAM2191 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2191 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2191 precursor RNA is designated SEQ ID:2177, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2177 is located at position 812 relative to the genome of Monkeypox virus.

[30633] VGAM2191 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2191 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure.

As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[30634] An enzyme complex designated DICER COMPLEX, dices the VGAM2191 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2191 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM2191 RNA is designated SEQ ID:4902, and is provided hereinbelow with reference to the sequence listing part.

[30635] VGAM2191 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2191 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2191 host target RNA, herein designated VGAM HOST TARGET RNA, comprises

three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[30636] VGAM2191 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2191 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2191 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2191 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2191 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an

example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[30637] The complementary binding of VGAM2191 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2191 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2191 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2191 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[30638] It is appreciated that VGAM2191 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2191 host target genes. The mRNA of each one of this plurality of VGAM2191 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2191 RNA, herein designated VGAM RNA, and which when bound by VGAM2191 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2191 host target proteins.

[30639] It is further appreciated by one skilled in the art that the

mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2191 gene, herein designated VGAM GENE, on one or more VGAM2191 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[30640] It is yet further appreciated that a function of VGAM2191 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2191 include diagnosis, prevention and treatment of viral infection by Monkeypox virus. Specific functions, and accordingly utilities, of VGAM2191 correlate with, and may be deduced from, the identity of the

host target genes which VGAM2191 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[30641] Nucleotide sequences of the VGAM2191 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2191 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2191 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2191 are further described hereinbelow with reference to Table 1.

[30642] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2191 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[30643] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2192 (VGAM2192) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[30644] VGAM2192 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2192 was detected is described hereinabove with reference to Figs. 2-8.

[30645] VGAM2192 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Monkeypox virus. VGAM2192 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[30646] VGAM2192 gene, herein designated VGAM GENE, encodes a VGAM2192 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2192 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2192 precursor RNA is designated SEQ ID:2178, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2178 is located at position 2502 relative to the genome of Monkeypox virus.

[30647] VGAM2192 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2192 folded precursor RNA, herein designated VGAM FOLDED PRECUR-

SOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[30648] An enzyme complex designated DICER COMPLEX, dices the VGAM2192 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2192 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM2192 RNA is designated SEQ ID:4903, and is provided hereinbelow with reference to the sequence listing part.

[30649] VGAM2192 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2192 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2192 host target RNA,

herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[30650] VGAM2192 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2192 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2192 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2192 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2192 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host tar-

get binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[30651] The complementary binding of VGAM2192 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2192 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2192 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2192 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[30652] It is appreciated that VGAM2192 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2192 host target genes. The mRNA of each one of this plurality of VGAM2192 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2192 RNA, herein designated VGAM RNA, and which when bound by VGAM2192 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2192 host target proteins.

[30653] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2192 gene, herein designated VGAM GENE, on one or more VGAM2192 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[30654] It is yet further appreciated that a function of VGAM2192 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2192 include diagnosis, prevention and treatment of viral infection by Monkeypox virus. Specific functions, and accordingly utilities, of VGAM2192 corre-

late with, and may be deduced from, the identity of the host target genes which VGAM2192 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[30655] Nucleotide sequences of the VGAM2192 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2192 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2192 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2192 are further described hereinbelow with reference to Table 1.

[30656] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2192 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[30657] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2193 (VGAM2193) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the

art.

[30658] VGAM2193 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2193 was detected is described hereinabove with reference to Figs. 2-8.

[30659] VGAM2193 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cowpox virus. VGAM2193 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[30660] VGAM2193 gene, herein designated VGAM GENE, encodes a VGAM2193 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2193 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2193 precursor RNA is designated SEQ ID:2179, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2179 is located at position 18641 relative to the genome of Cowpox virus.

[30661] VGAM2193 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2193 folded

precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[30662] An enzyme complex designated DICER COMPLEX, dices the VGAM2193 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2193 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 56%) nucleotide sequence of VGAM2193 RNA is designated SEQ ID:4904, and is provided hereinbelow with reference to the sequence listing part.

[30663] VGAM2193 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2193 host target RNA, herein designated

VGAM HOST TARGET RNA. VGAM2193 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[30664] VGAM2193 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2193 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2193 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2193 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2193 host target RNA, herein designated VGAM HOST TARGET RNA.

It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[30665] The complementary binding of VGAM2193 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2193 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2193 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2193 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[30666] It is appreciated that VGAM2193 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2193 host target genes. The mRNA of each one of this plurality of VGAM2193 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2193 RNA, herein designated VGAM RNA, and which when bound by VGAM2193 RNA, herein designated VGAM RNA, causes inhibition of translation of

respective one or more VGAM2193 host target proteins.

[30667] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2193 gene, herein designated VGAM GENE, on one or more VGAM2193 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[30668] It is yet further appreciated that a function of VGAM2193 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2193 include diagnosis, prevention and treatment of viral infection by Cowpox virus. Specific

functions, and accordingly utilities, of VGAM2193 correlate with, and may be deduced from, the identity of the host target genes which VGAM2193 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[30669] Nucleotide sequences of the VGAM2193 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2193 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2193 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2193 are further described hereinbelow with reference to Table 1.

[30670] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2193 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[30671] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2194 (VGAM2194) viral gene, which modulates expression of respective host target genes thereof, the func-

tion and utility of which host target genes is known in the art.

[30672] VGAM2194 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2194 was detected is described hereinabove with reference to Figs. 2-8.

[30673] VGAM2194 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Monkeypox virus. VGAM2194 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[30674] VGAM2194 gene, herein designated VGAM GENE, encodes a VGAM2194 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2194 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2194 precursor RNA is designated SEQ ID:2180, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2180 is located at position 269 relative to the genome of Monkeypox virus.

[30675] VGAM2194 precursor RNA, herein designated VGAM PRE-

CURSOR RNA, folds onto itself, forming VGAM2194 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[30676] An enzyme complex designated DICER COMPLEX, dices the VGAM2194 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2194 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 44%) nucleotide sequence of VGAM2194 RNA is designated SEQ ID:4905, and is provided hereinbelow with reference to the sequence listing part.

[30677] VGAM2194 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger

RNA, VGAM2194 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2194 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[30678] VGAM2194 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2194 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2194 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2194 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2194 host

target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[30679] The complementary binding of VGAM2194 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2194 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2194 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2194 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[30680] It is appreciated that VGAM2194 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2194 host target genes. The mRNA of each one of this plurality of VGAM2194 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2194 RNA, herein designated VGAM RNA, and which when bound by VGAM2194 RNA, herein

designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2194 host target proteins.

[30681] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2194 gene, herein designated VGAM GENE, on one or more VGAM2194 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[30682] It is yet further appreciated that a function of VGAM2194 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2194 include diagnosis, prevention and

treatment of viral infection by Monkeypox virus. Specific functions, and accordingly utilities, of VGAM2194 correlate with, and may be deduced from, the identity of the host target genes which VGAM2194 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[30683] Nucleotide sequences of the VGAM2194 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2194 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2194 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2194 are further described hereinbelow with reference to Table 1.

[30684] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2194 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[30685] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2195 (VGAM2195) viral gene, which modulates ex-

pression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[30686] VGAM2195 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2195 was detected is described hereinabove with reference to Figs. 2-8.

[30687] VGAM2195 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Yaba-like disease virus. VGAM2195 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[30688] VGAM2195 gene, herein designated VGAM GENE, encodes a VGAM2195 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2195 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2195 precursor RNA is designated SEQ ID:2181, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2181 is located at position 9471 relative to the genome of Yaba-like disease virus.

[30689] VGAM2195 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2195 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[30690] An enzyme complex designated DICER COMPLEX, dices the VGAM2195 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2195 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 52%) nucleotide sequence of VGAM2195 RNA is designated SEQ ID:4906, and is provided hereinbelow with reference to the sequence listing part.

[30691] VGAM2195 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2195 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2195 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[30692] VGAM2195 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2195 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2195 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2195 RNA, herein designated VGAM RNA, may have a different number of host target

binding sites in untranslated regions of a VGAM2195 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[30693] The complementary binding of VGAM2195 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2195 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2195 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2195 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[30694] It is appreciated that VGAM2195 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2195 host target genes. The mRNA of each one of this plurality of VGAM2195 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2195 RNA, herein designated VGAM

RNA, and which when bound by VGAM2195 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2195 host target proteins.

[30695] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2195 gene, herein designated VGAM GENE, on one or more VGAM2195 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[30696] It is yet further appreciated that a function of VGAM2195 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly,

utilities of VGAM2195 include diagnosis, prevention and treatment of viral infection by Yaba-like disease virus. Specific functions, and accordingly utilities, of VGAM2195 correlate with, and may be deduced from, the identity of the host target genes which VGAM2195 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[30697] Nucleotide sequences of the VGAM2195 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2195 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2195 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2195 are further described hereinbelow with reference to Table 1.

[30698] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2195 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[30699] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Mes-

senger 2196 (VGAM2196) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[30700] VGAM2196 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2196 was detected is described hereinabove with reference to Figs. 2-8.

[30701] VGAM2196 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Yaba-like disease virus. VGAM2196 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[30702] VGAM2196 gene, herein designated VGAM GENE, encodes a VGAM2196 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2196 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2196 precursor RNA is designated SEQ ID:2182, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2182 is located at position

11842 relative to the genome of Yaba-like disease virus.

[30703] VGAM2196 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2196 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[30704] An enzyme complex designated DICER COMPLEX, dices the VGAM2196 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2196 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM2196 RNA is designated SEQ ID:4907, and is provided hereinbelow with reference to the sequence listing part.

[30705] VGAM2196 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2196 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2196 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[30706] VGAM2196 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2196 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2196 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2196 RNA, herein designated

VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2196 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[30707] The complementary binding of VGAM2196 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2196 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2196 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2196 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[30708] It is appreciated that VGAM2196 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2196 host target genes. The mRNA of each one of this plurality of VGAM2196 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly com-

plementary to VGAM2196 RNA, herein designated VGAM RNA, and which when bound by VGAM2196 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2196 host target proteins.

[30709] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2196 gene, herein designated VGAM GENE, on one or more VGAM2196 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[30710] It is yet further appreciated that a function of VGAM2196 is inhibition of expression of host target genes, as part of

a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2196 include diagnosis, prevention and treatment of viral infection by Yaba-like disease virus. Specific functions, and accordingly utilities, of VGAM2196 correlate with, and may be deduced from, the identity of the host target genes which VGAM2196 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[30711] Nucleotide sequences of the VGAM2196 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2196 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2196 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2196 are further described hereinbelow with reference to Table 1.

[30712] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2196 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[30713] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present

invention, referred to here as Viral Genomic Address Messenger 2197 (VGAM2197) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[30714] VGAM2197 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2197 was detected is described hereinabove with reference to Figs. 2-8.

[30715] VGAM2197 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Yaba-like disease virus. VGAM2197 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[30716] VGAM2197 gene, herein designated VGAM GENE, encodes a VGAM2197 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2197 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2197 precursor RNA is designated SEQ ID:2183, and is provided hereinbelow with reference to the sequence listing part. Nu-

cleotide sequence SEQ ID:2183 is located at position 6543 relative to the genome of Yaba-like disease virus.

[30717] VGAM2197 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2197 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[30718] An enzyme complex designated DICER COMPLEX, dices the VGAM2197 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2197 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 45%) nucleotide sequence of VGAM2197 RNA is designated SEQ ID:4908, and is provided hereinbelow with reference to the sequence

listing part.

[30719] VGAM2197 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2197 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2197 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[30720] VGAM2197 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2197 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2197 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not

meant to be limiting VGAM2197 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2197 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[30721] The complementary binding of VGAM2197 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2197 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2197 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2197 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[30722] It is appreciated that VGAM2197 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2197 host target genes. The mRNA of each one of this plurality of VGAM2197 host target genes comprises one or more host target binding sites, each

having a nucleotide sequence which is at least partly complementary to VGAM2197 RNA, herein designated VGAM RNA, and which when bound by VGAM2197 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2197 host target proteins.

[30723] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2197 gene, herein designated VGAM GENE, on one or more VGAM2197 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[30724] It is yet further appreciated that a function of VGAM2197

is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2197 include diagnosis, prevention and treatment of viral infection by Yaba-like disease virus. Specific functions, and accordingly utilities, of VGAM2197 correlate with, and may be deduced from, the identity of the host target genes which VGAM2197 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[30725] Nucleotide sequences of the VGAM2197 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2197 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2197 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2197 are further described hereinbelow with reference to Table 1.

[30726] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2197 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[30727] Fig. 1 further provides a conceptual description of another

novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2198 (VGAM2198) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[30728] VGAM2198 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2198 was detected is described hereinabove with reference to Figs. 2-8.

[30729] VGAM2198 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Yaba-like disease virus. VGAM2198 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[30730] VGAM2198 gene, herein designated VGAM GENE, encodes a VGAM2198 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2198 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2198 precursor RNA is designated SEQ ID:2184, and is provided here-

inbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2184 is located at position 22309 relative to the genome of Yaba-like disease virus.

[30731] VGAM2198 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2198 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[30732] An enzyme complex designated DICER COMPLEX, dices the VGAM2198 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2198 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM2198 RNA is designated SEQ ID:4909, and

is provided hereinbelow with reference to the sequence listing part.

[30733] VGAM2198 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2198 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2198 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[30734] VGAM2198 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2198 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2198 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites

shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2198 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2198 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[30735] The complementary binding of VGAM2198 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2198 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2198 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2198 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[30736] It is appreciated that VGAM2198 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2198 host target genes. The mRNA of each one of this plurality of VGAM2198 host target genes

comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2198 RNA, herein designated VGAM RNA, and which when bound by VGAM2198 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2198 host target proteins.

[30737] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2198 gene, herein designated VGAM GENE, on one or more VGAM2198 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[30738] It is yet further appreciated that a function of VGAM2198 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2198 include diagnosis, prevention and treatment of viral infection by Yaba-like disease virus. Specific functions, and accordingly utilities, of VGAM2198 correlate with, and may be deduced from, the identity of the host target genes which VGAM2198 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[30739] Nucleotide sequences of the VGAM2198 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2198 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2198 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2198 are further described hereinbelow with reference to Table 1.

[30740] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2198 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[30741] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2199 (VGAM2199) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[30742] VGAM2199 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2199 was detected is described hereinabove with reference to Figs. 2-8.

[30743] VGAM2199 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Yaba-like disease virus. VGAM2199 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[30744] VGAM2199 gene, herein designated VGAM GENE, encodes a VGAM2199 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2199 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2199 precur-

sor RNA is designated SEQ ID:2185, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2185 is located at position 3375 relative to the genome of Yaba-like disease virus.

[30745] VGAM2199 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2199 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[30746] An enzyme complex designated DICER COMPLEX, dices the VGAM2199 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2199 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide se-

quence of VGAM2199 RNA is designated SEQ ID:4910, and is provided hereinbelow with reference to the sequence listing part.

[30747] VGAM2199 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2199 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2199 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[30748] VGAM2199 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2199 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2199 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is ap-

preciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2199 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2199 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[30749] The complementary binding of VGAM2199 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2199 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2199 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2199 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[30750] It is appreciated that VGAM2199 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2199 host target genes. The mRNA of

each one of this plurality of VGAM2199 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2199 RNA, herein designated VGAM RNA, and which when bound by VGAM2199 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2199 host target proteins.

[30751] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2199 gene, herein designated VGAM GENE, on one or more VGAM2199 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science

294,779 (2001)).

[30752] It is yet further appreciated that a function of VGAM2199 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2199 include diagnosis, prevention and treatment of viral infection by Yaba-like disease virus. Specific functions, and accordingly utilities, of VGAM2199 correlate with, and may be deduced from, the identity of the host target genes which VGAM2199 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[30753] Nucleotide sequences of the VGAM2199 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2199 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2199 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2199 are further described hereinbelow with reference to Table 1.

[30754] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2199 RNA, herein designated VGAM RNA, are de-

scribed hereinbelow with reference to Table 2.

[30755] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2200 (VGAM2200) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[30756] VGAM2200 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2200 was detected is described hereinabove with reference to Figs. 2-8.

[30757] VGAM2200 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cowpox virus.
VGAM2200 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[30758] VGAM2200 gene, herein designated VGAM GENE, encodes a VGAM2200 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2200 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly

similar to the nucleotide sequence of VGAM2200 precursor RNA is designated SEQ ID:2186, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2186 is located at position 184637 relative to the genome of Cowpox virus.

[30759] VGAM2200 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2200 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[30760] An enzyme complex designated DICER COMPLEX, dices the VGAM2200 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2200 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other

necessary proteins. A probable (over 70%) nucleotide sequence of VGAM2200 RNA is designated SEQ ID:4911, and is provided hereinbelow with reference to the sequence listing part.

[30761] VGAM2200 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2200 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2200 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[30762] VGAM2200 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2200 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2200 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I,

BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2200 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2200 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[30763] The complementary binding of VGAM2200 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2200 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2200 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2200 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[30764] It is appreciated that VGAM2200 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents

a plurality of VGAM2200 host target genes. The mRNA of each one of this plurality of VGAM2200 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2200 RNA, herein designated VGAM RNA, and which when bound by VGAM2200 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2200 host target proteins.

[30765] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2200 gene, herein designated VGAM GENE, on one or more VGAM2200 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[30766] It is yet further appreciated that a function of VGAM2200 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2200 include diagnosis, prevention and treatment of viral infection by Cowpox virus. Specific functions, and accordingly utilities, of VGAM2200 correlate with, and may be deduced from, the identity of the host target genes which VGAM2200 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[30767] Nucleotide sequences of the VGAM2200 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2200 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2200 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2200 are further described hereinbelow with reference to Table 1.

[30768] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites

to VGAM2200 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[30769] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2201 (VGAM2201) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[30770] VGAM2201 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2201 was detected is described hereinabove with reference to Figs. 2-8.

[30771] VGAM2201 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cowpox virus.
VGAM2201 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[30772] VGAM2201 gene, herein designated VGAM GENE, encodes a VGAM2201 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2201 precursor RNA, herein designated VGAM PRECURSOR RNA, does not en-

code a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2201 precursor RNA is designated SEQ ID:2187, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2187 is located at position 185848 relative to the genome of Cowpox virus.

[30773] VGAM2201 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2201 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[30774] An enzyme complex designated DICER COMPLEX, dices the VGAM2201 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2201 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide sequence of VGAM2201 RNA is designated SEQ ID:4912, and is provided hereinbelow with reference to the sequence listing part.

[30775] VGAM2201 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2201 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2201 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[30776] VGAM2201 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2201 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2201 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3

such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2201 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2201 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[30777] The complementary binding of VGAM2201 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2201 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2201 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2201 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[30778] It is appreciated that VGAM2201 host target gene, herein

designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2201 host target genes. The mRNA of each one of this plurality of VGAM2201 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2201 RNA, herein designated VGAM RNA, and which when bound by VGAM2201 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2201 host target proteins.

[30779] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2201 gene, herein designated VGAM GENE, on one or more VGAM2201 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these

other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[30780] It is yet further appreciated that a function of VGAM2201 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2201 include diagnosis, prevention and treatment of viral infection by Cowpox virus. Specific functions, and accordingly utilities, of VGAM2201 correlate with, and may be deduced from, the identity of the host target genes which VGAM2201 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[30781] Nucleotide sequences of the VGAM2201 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2201 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2201 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2201 are further described hereinbelow with reference to Table 1.

[30782] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the

complementarity of each of these host target binding sites to VGAM2201 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[30783] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2202 (VGAM2202) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[30784] VGAM2202 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2202 was detected is described hereinabove with reference to Figs. 2-8.

[30785] VGAM2202 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Camelpox virus. VGAM2202 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[30786] VGAM2202 gene, herein designated VGAM GENE, encodes a VGAM2202 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2202 precursor RNA,

herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2202 precursor RNA is designated SEQ ID:2188, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2188 is located at position 162506 relative to the genome of Camelpox virus.

[30787] VGAM2202 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2202 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[30788] An enzyme complex designated DICER COMPLEX, dices the VGAM2202 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2202 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short

~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of VGAM2202 RNA is designated SEQ ID:4913, and is provided hereinbelow with reference to the sequence listing part.

[30789] VGAM2202 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2202 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2202 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[30790] VGAM2202 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2202 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2202 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host

target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2202 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2202 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[30791] The complementary binding of VGAM2202 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2202 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2202 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2202 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[30792] It is appreciated that VGAM2202 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2202 host target genes. The mRNA of each one of this plurality of VGAM2202 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2202 RNA, herein designated VGAM RNA, and which when bound by VGAM2202 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2202 host target proteins.

[30793] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2202 gene, herein designated VGAM GENE, on one or more VGAM2202 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, al-

though specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[30794] It is yet further appreciated that a function of VGAM2202 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2202 include diagnosis, prevention and treatment of viral infection by Camelpox virus. Specific functions, and accordingly utilities, of VGAM2202 correlate with, and may be deduced from, the identity of the host target genes which VGAM2202 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[30795] Nucleotide sequences of the VGAM2202 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2202 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2202 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2202 are further described hereinbelow with reference to Table 1.

[30796] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of

Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2202 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[30797] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2203 (VGAM2203) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[30798] VGAM2203 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2203 was detected is described hereinabove with reference to Figs. 2-8.

[30799] VGAM2203 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cowpox virus. VGAM2203 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[30800] VGAM2203 gene, herein designated VGAM GENE, encodes a VGAM2203 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and un-

like most ordinary genes, VGAM2203 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2203 precursor RNA is designated SEQ ID:2189, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2189 is located at position 173794 relative to the genome of Cowpox virus.

[30801] VGAM2203 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2203 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[30802] An enzyme complex designated DICER COMPLEX, dices the VGAM2203 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2203 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a

hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide sequence of VGAM2203 RNA is designated SEQ ID:4914, and is provided hereinbelow with reference to the sequence listing part.

[30803] VGAM2203 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2203 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2203 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[30804] VGAM2203 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2203 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2203 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed

sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2203 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2203 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[30805] The complementary binding of VGAM2203 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2203 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2203 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2203 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target

protein is therefore outlined by a broken line.

[30806] It is appreciated that VGAM2203 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2203 host target genes. The mRNA of each one of this plurality of VGAM2203 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2203 RNA, herein designated VGAM RNA, and which when bound by VGAM2203 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2203 host target proteins.

[30807] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2203 gene, herein designated VGAM GENE, on one or more VGAM2203 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate ex-

pression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[30808] It is yet further appreciated that a function of VGAM2203 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2203 include diagnosis, prevention and treatment of viral infection by Cowpox virus. Specific functions, and accordingly utilities, of VGAM2203 correlate with, and may be deduced from, the identity of the host target genes which VGAM2203 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[30809] Nucleotide sequences of the VGAM2203 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2203 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2203 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2203 are further described hereinbelow with reference to Table 1.

[30810] Nucleotide sequences of host target binding sites, such as

BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2203 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[30811] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2204 (VGAM2204) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[30812] VGAM2204 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2204 was detected is described hereinabove with reference to Figs. 2-8.

[30813] VGAM2204 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cowpox virus.
VGAM2204 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[30814] VGAM2204 gene, herein designated VGAM GENE, encodes a VGAM2204 precursor RNA, herein designated VGAM

PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2204 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2204 precursor RNA is designated SEQ ID:2190, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2190 is located at position 183474 relative to the genome of Cowpox virus.

[30815] VGAM2204 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2204 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[30816] An enzyme complex designated DICER COMPLEX, dices the VGAM2204 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2204 RNA, herein designated VGAM RNA, a single stranded ~22 nt

long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide sequence of VGAM2204 RNA is designated SEQ ID:4915, and is provided hereinbelow with reference to the sequence listing part.

[30817] VGAM2204 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2204 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2204 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[30818] VGAM2204 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2204 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2204 RNA, herein designated

VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2204 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2204 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[30819] The complementary binding of VGAM2204 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2204 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2204 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2204 host target protein, herein desig-

nated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[30820] It is appreciated that VGAM2204 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2204 host target genes. The mRNA of each one of this plurality of VGAM2204 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2204 RNA, herein designated VGAM RNA, and which when bound by VGAM2204 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2204 host target proteins.

[30821] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2204 gene, herein designated VGAM GENE, on one or more VGAM2204 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are

also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[30822] It is yet further appreciated that a function of VGAM2204 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2204 include diagnosis, prevention and treatment of viral infection by Cowpox virus. Specific functions, and accordingly utilities, of VGAM2204 correlate with, and may be deduced from, the identity of the host target genes which VGAM2204 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[30823] Nucleotide sequences of the VGAM2204 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2204 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2204 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2204 are further described hereinbelow with reference to Table 1.

[30824] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2204 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[30825] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2205 (VGAM2205) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[30826] VGAM2205 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2205 was detected is described hereinabove with reference to Figs. 2-8.

[30827] VGAM2205 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cowpox virus.
VGAM2205 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[30828] VGAM2205 gene, herein designated VGAM GENE, encodes

a VGAM2205 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2205 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2205 precursor RNA is designated SEQ ID:2191, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2191 is located at position 188975 relative to the genome of Cowpox virus.

[30829] VGAM2205 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2205 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[30830] An enzyme complex designated DICER COMPLEX, dices the VGAM2205 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2205 RNA,

herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 44%) nucleotide sequence of VGAM2205 RNA is designated SEQ ID:4916, and is provided hereinbelow with reference to the sequence listing part.

[30831] VGAM2205 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2205 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2205 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[30832] VGAM2205 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2205 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nu-

cleotide sequence of VGAM2205 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2205 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2205 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[30833] The complementary binding of VGAM2205 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2205 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2205 host target RNA, herein designated VGAM HOST TARGET

RNA, into VGAM2205 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[30834] It is appreciated that VGAM2205 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2205 host target genes. The mRNA of each one of this plurality of VGAM2205 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2205 RNA, herein designated VGAM RNA, and which when bound by VGAM2205 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2205 host target proteins.

[30835] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2205 gene, herein designated VGAM GENE, on one or more VGAM2205 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4

and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[30836] It is yet further appreciated that a function of VGAM2205 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2205 include diagnosis, prevention and treatment of viral infection by Cowpox virus. Specific functions, and accordingly utilities, of VGAM2205 correlate with, and may be deduced from, the identity of the host target genes which VGAM2205 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[30837] Nucleotide sequences of the VGAM2205 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2205 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2205 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2205 are further

described hereinbelow with reference to Table 1.

[30838] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2205 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[30839] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2206 (VGAM2206) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[30840] VGAM2206 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2206 was detected is described hereinabove with reference to Figs. 2-8.

[30841] VGAM2206 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cowpox virus.
VGAM2206 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[30842] VGAM2206 gene, herein designated VGAM GENE, encodes a VGAM2206 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2206 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2206 precursor RNA is designated SEQ ID:2192, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2192 is located at position 178296 relative to the genome of Cowpox virus.

[30843] VGAM2206 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2206 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[30844] An enzyme complex designated DICER COMPLEX, dices the VGAM2206 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, into VGAM2206 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 63%) nucleotide sequence of VGAM2206 RNA is designated SEQ ID:4917, and is provided hereinbelow with reference to the sequence listing part.

[30845] VGAM2206 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2206 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2206 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[30846] VGAM2206 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2206 host target RNA, herein designated VGAM HOST TARGET RNA. This

complementary binding is due to the fact that the nucleotide sequence of VGAM2206 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2206 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2206 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[30847] The complementary binding of VGAM2206 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2206 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2206

host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2206 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[30848] It is appreciated that VGAM2206 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2206 host target genes. The mRNA of each one of this plurality of VGAM2206 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2206 RNA, herein designated VGAM RNA, and which when bound by VGAM2206 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2206 host target proteins.

[30849] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2206 gene, herein designated VGAM GENE, on one or more VGAM2206 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated

only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[30850] It is yet further appreciated that a function of VGAM2206 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2206 include diagnosis, prevention and treatment of viral infection by Cowpox virus. Specific functions, and accordingly utilities, of VGAM2206 correlate with, and may be deduced from, the identity of the host target genes which VGAM2206 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[30851] Nucleotide sequences of the VGAM2206 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2206 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2206 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, of VGAM2206 are further described hereinbelow with reference to Table 1.

[30852] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2206 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[30853] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2207 (VGAM2207) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[30854] VGAM2207 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2207 was detected is described hereinabove with reference to Figs. 2-8.

[30855] VGAM2207 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Myxoma virus. VGAM2207 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the

human genome.

[30856] VGAM2207 gene, herein designated VGAM GENE, encodes a VGAM2207 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2207 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2207 precursor RNA is designated SEQ ID:2193, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2193 is located at position 11555 relative to the genome of Myxoma virus.

[30857] VGAM2207 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2207 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[30858] An enzyme complex designated DICER COMPLEX, dices

the VGAM2207 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2207 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM2207 RNA is designated SEQ ID:4918, and is provided hereinbelow with reference to the sequence listing part.

[30859] VGAM2207 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2207 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2207 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[30860] VGAM2207 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2207 host target

RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2207 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2207 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2207 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[30861] The complementary binding of VGAM2207 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2207 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE

II and BINDING SITE III, inhibits translation of VGAM2207 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2207 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[30862] It is appreciated that VGAM2207 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2207 host target genes. The mRNA of each one of this plurality of VGAM2207 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2207 RNA, herein designated VGAM RNA, and which when bound by VGAM2207 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2207 host target proteins.

[30863] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2207 gene, herein designated VGAM GENE, on one or more VGAM2207 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a spe-

cific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[30864] It is yet further appreciated that a function of VGAM2207 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2207 include diagnosis, prevention and treatment of viral infection by Myxoma virus. Specific functions, and accordingly utilities, of VGAM2207 correlate with, and may be deduced from, the identity of the host target genes which VGAM2207 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[30865] Nucleotide sequences of the VGAM2207 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2207 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of

VGAM2207 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2207 are further described hereinbelow with reference to Table 1.

[30866] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2207 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[30867] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2208 (VGAM2208) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[30868] VGAM2208 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2208 was detected is described hereinabove with reference to Figs. 2-8.

[30869] VGAM2208 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Myxoma virus. VGAM2208 host target gene, herein designated VGAM

HOST TARGET GENE, is a human gene contained in the human genome.

[30870] VGAM2208 gene, herein designated VGAM GENE, encodes a VGAM2208 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2208 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2208 precursor RNA is designated SEQ ID:2194, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2194 is located at position 21539 relative to the genome of Myxoma virus.

[30871] VGAM2208 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2208 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[30872] An enzyme complex designated DICER COMPLEX, dices the VGAM2208 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2208 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM2208 RNA is designated SEQ ID:4919, and is provided hereinbelow with reference to the sequence listing part.

[30873] VGAM2208 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2208 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2208 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[30874] VGAM2208 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites

located in untranslated regions of VGAM2208 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2208 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2208 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2208 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[30875] The complementary binding of VGAM2208 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2208 host target RNA, herein designated VGAM

HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2208 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2208 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[30876] It is appreciated that VGAM2208 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2208 host target genes. The mRNA of each one of this plurality of VGAM2208 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2208 RNA, herein designated VGAM RNA, and which when bound by VGAM2208 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2208 host target proteins.

[30877] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2208 gene, herein designated VGAM GENE, on one or more VGAM2208 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove

with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[30878] It is yet further appreciated that a function of VGAM2208 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2208 include diagnosis, prevention and treatment of viral infection by Myxoma virus. Specific functions, and accordingly utilities, of VGAM2208 correlate with, and may be deduced from, the identity of the host target genes which VGAM2208 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[30879] Nucleotide sequences of the VGAM2208 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2208 RNA, herein designated VGAM RNA, and

a schematic representation of the secondary folding of VGAM2208 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2208 are further described hereinbelow with reference to Table 1.

[30880] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2208 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[30881] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2209 (VGAM2209) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[30882] VGAM2209 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2209 was detected is described hereinabove with reference to Figs. 2-8.

[30883] VGAM2209 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Myxoma virus.

VGAM2209 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[30884] VGAM2209 gene, herein designated VGAM GENE, encodes a VGAM2209 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2209 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2209 precursor RNA is designated SEQ ID:2195, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2195 is located at position 1250 relative to the genome of Myxoma virus.

[30885] VGAM2209 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2209 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of

the second half thereof.

[30886] An enzyme complex designated DICER COMPLEX, dices the VGAM2209 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2209 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM2209 RNA is designated SEQ ID:4920, and is provided hereinbelow with reference to the sequence listing part.

[30887] VGAM2209 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2209 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2209 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[30888] VGAM2209 RNA, herein designated VGAM RNA, binds

complementarily to one or more host target binding sites located in untranslated regions of VGAM2209 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2209 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2209 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2209 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[30889] The complementary binding of VGAM2209 RNA, herein designated VGAM RNA, to host target binding sites on

VGAM2209 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2209 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2209 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[30890] It is appreciated that VGAM2209 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2209 host target genes. The mRNA of each one of this plurality of VGAM2209 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2209 RNA, herein designated VGAM RNA, and which when bound by VGAM2209 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2209 host target proteins.

[30891] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2209 gene, herein designated VGAM GENE, on one or more VGAM2209 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other

known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[30892] It is yet further appreciated that a function of VGAM2209 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2209 include diagnosis, prevention and treatment of viral infection by Myxoma virus. Specific functions, and accordingly utilities, of VGAM2209 correlate with, and may be deduced from, the identity of the host target genes which VGAM2209 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[30893] Nucleotide sequences of the VGAM2209 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the

diced VGAM2209 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2209 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2209 are further described hereinbelow with reference to Table 1.

[30894] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2209 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[30895] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2210 (VGAM2210) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[30896] VGAM2210 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2210 was detected is described hereinabove with reference to Figs. 2-8.

[30897] VGAM2210 gene, herein designated VGAM GENE, is a viral

gene contained in the genome of Myxoma virus. VGAM2210 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[30898] VGAM2210 gene, herein designated VGAM GENE, encodes a VGAM2210 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2210 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2210 precursor RNA is designated SEQ ID:2196, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2196 is located at position 12338 relative to the genome of Myxoma virus.

[30899] VGAM2210 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2210 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial

inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[30900] An enzyme complex designated DICER COMPLEX, dices the VGAM2210 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2210 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM2210 RNA is designated SEQ ID:4921, and is provided hereinbelow with reference to the sequence listing part.

[30901] VGAM2210 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2210 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2210 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[30902] VGAM2210 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2210 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2210 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2210 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2210 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[30903] The complementary binding of VGAM2210 RNA, herein

designated VGAM RNA, to host target binding sites on VGAM2210 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2210 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2210 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[30904] It is appreciated that VGAM2210 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2210 host target genes. The mRNA of each one of this plurality of VGAM2210 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2210 RNA, herein designated VGAM RNA, and which when bound by VGAM2210 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2210 host target proteins.

[30905] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2210 gene, herein designated VGAM GENE, on one or more VGAM2210 host target gene, herein designated

VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[30906] It is yet further appreciated that a function of VGAM2210 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2210 include diagnosis, prevention and treatment of viral infection by Myxoma virus. Specific functions, and accordingly utilities, of VGAM2210 correlate with, and may be deduced from, the identity of the host target genes which VGAM2210 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[30907] Nucleotide sequences of the VGAM2210 precursor RNA,

herein designated VGAM PRECURSOR RNA, and of the diced VGAM2210 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2210 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2210 are further described hereinbelow with reference to Table 1.

[30908] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2210 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[30909] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2211 (VGAM2211) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[30910] VGAM2211 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2211 was detected is described hereinabove with reference to Figs. 2-8.

[30911] VGAM2211 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Myxoma virus. VGAM2211 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[30912] VGAM2211 gene, herein designated VGAM GENE, encodes a VGAM2211 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2211 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2211 precursor RNA is designated SEQ ID:2197, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2197 is located at position 17880 relative to the genome of Myxoma virus.

[30913] VGAM2211 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2211 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the

RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[30914] An enzyme complex designated DICER COMPLEX, dices the VGAM2211 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2211 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 45%) nucleotide sequence of VGAM2211 RNA is designated SEQ ID:4922, and is provided hereinbelow with reference to the sequence listing part.

[30915] VGAM2211 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2211 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2211 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN COD-

ING and 3UTR respectively.

[30916] VGAM2211 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2211 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2211 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2211 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2211 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[30917] The complementary binding of VGAM2211 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2211 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2211 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2211 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[30918] It is appreciated that VGAM2211 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2211 host target genes. The mRNA of each one of this plurality of VGAM2211 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2211 RNA, herein designated VGAM RNA, and which when bound by VGAM2211 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2211 host target proteins.

[30919] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2211 gene, herein designated VGAM GENE, on one

or more VGAM2211 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[30920] It is yet further appreciated that a function of VGAM2211 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2211 include diagnosis, prevention and treatment of viral infection by Myxoma virus. Specific functions, and accordingly utilities, of VGAM2211 correlate with, and may be deduced from, the identity of the host target genes which VGAM2211 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[30921] Nucleotide sequences of the VGAM2211 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2211 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2211 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2211 are further described hereinbelow with reference to Table 1.

[30922] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2211 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[30923] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2212 (VGAM2212) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[30924] VGAM2212 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2212 was detected is de-

scribed hereinabove with reference to Figs. 2-8.

[30925] VGAM2212 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Myxoma virus. VGAM2212 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[30926] VGAM2212 gene, herein designated VGAM GENE, encodes a VGAM2212 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2212 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2212 precursor RNA is designated SEQ ID:2198, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2198 is located at position 11366 relative to the genome of Myxoma virus.

[30927] VGAM2212 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2212 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the

fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[30928] An enzyme complex designated DICER COMPLEX, dices the VGAM2212 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2212 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 66%) nucleotide sequence of VGAM2212 RNA is designated SEQ ID:4923, and is provided hereinbelow with reference to the sequence listing part.

[30929] VGAM2212 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2212 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2212 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and

a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[30930] VGAM2212 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2212 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2212 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2212 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2212 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both

3UTR and 5UTR regions.

[30931] The complementary binding of VGAM2212 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2212 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2212 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2212 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[30932] It is appreciated that VGAM2212 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2212 host target genes. The mRNA of each one of this plurality of VGAM2212 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2212 RNA, herein designated VGAM RNA, and which when bound by VGAM2212 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2212 host target proteins.

[30933] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by

VGAM2212 gene, herein designated VGAM GENE, on one or more VGAM2212 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[30934] It is yet further appreciated that a function of VGAM2212 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2212 include diagnosis, prevention and treatment of viral infection by Myxoma virus. Specific functions, and accordingly utilities, of VGAM2212 correlate with, and may be deduced from, the identity of the host target genes which VGAM2212 binds and inhibits, and the function of these host target genes, as elaborated

hereinbelow.

[30935] Nucleotide sequences of the VGAM2212 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2212 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2212 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2212 are further described hereinbelow with reference to Table 1.

[30936] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2212 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[30937] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2213 (VGAM2213) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[30938] VGAM2213 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene.

The method by which VGAM2213 was detected is described hereinabove with reference to Figs. 2-8.

[30939] VGAM2213 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Myxoma virus. VGAM2213 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[30940] VGAM2213 gene, herein designated VGAM GENE, encodes a VGAM2213 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2213 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2213 precursor RNA is designated SEQ ID:2199, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2199 is located at position 12976 relative to the genome of Myxoma virus.

[30941] VGAM2213 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2213 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typi-

cal of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[30942] An enzyme complex designated DICER COMPLEX, dices the VGAM2213 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2213 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 83%) nucleotide sequence of VGAM2213 RNA is designated SEQ ID:4924, and is provided hereinbelow with reference to the sequence listing part.

[30943] VGAM2213 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2213 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2213 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding

gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[30944] VGAM2213 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2213 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2213 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2213 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2213 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be lo-

cated in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[30945] The complementary binding of VGAM2213 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2213 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2213 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2213 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[30946] It is appreciated that VGAM2213 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2213 host target genes. The mRNA of each one of this plurality of VGAM2213 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2213 RNA, herein designated VGAM RNA, and which when bound by VGAM2213 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2213 host target proteins.

[30947] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with

specific reference to translational inhibition exerted by VGAM2213 gene, herein designated VGAM GENE, on one or more VGAM2213 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[30948] It is yet further appreciated that a function of VGAM2213 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2213 include diagnosis, prevention and treatment of viral infection by Myxoma virus. Specific functions, and accordingly utilities, of VGAM2213 correlate with, and may be deduced from, the identity of the host target genes which VGAM2213 binds and inhibits,

and the function of these host target genes, as elaborated hereinbelow.

[30949] Nucleotide sequences of the VGAM2213 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2213 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2213 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2213 are further described hereinbelow with reference to Table 1.

[30950] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2213 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[30951] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2214 (VGAM2214) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[30952] VGAM2214 is a novel bioinformatically detected regula-

tory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2214 was detected is described hereinabove with reference to Figs. 2-8.

[30953] VGAM2214 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Myxoma virus. VGAM2214 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[30954] VGAM2214 gene, herein designated VGAM GENE, encodes a VGAM2214 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2214 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2214 precursor RNA is designated SEQ ID:2200, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2200 is located at position 20836 relative to the genome of Myxoma virus.

[30955] VGAM2214 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2214 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure.

As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[30956] An enzyme complex designated DICER COMPLEX, dices the VGAM2214 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2214 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM2214 RNA is designated SEQ ID:4925, and is provided hereinbelow with reference to the sequence listing part.

[30957] VGAM2214 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2214 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2214 host target RNA, herein designated VGAM HOST TARGET RNA, comprises

three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[30958] VGAM2214 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2214 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2214 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2214 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2214 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an

example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[30959] The complementary binding of VGAM2214 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2214 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2214 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2214 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[30960] It is appreciated that VGAM2214 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2214 host target genes. The mRNA of each one of this plurality of VGAM2214 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2214 RNA, herein designated VGAM RNA, and which when bound by VGAM2214 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2214 host target proteins.

[30961] It is further appreciated by one skilled in the art that the

mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2214 gene, herein designated VGAM GENE, on one or more VGAM2214 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[30962] It is yet further appreciated that a function of VGAM2214 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2214 include diagnosis, prevention and treatment of viral infection by Myxoma virus. Specific functions, and accordingly utilities, of VGAM2214 correlate with, and may be deduced from, the identity of the

host target genes which VGAM2214 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[30963] Nucleotide sequences of the VGAM2214 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2214 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2214 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2214 are further described hereinbelow with reference to Table 1.

[30964] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2214 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[30965] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2215 (VGAM2215) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[30966] VGAM2215 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2215 was detected is described hereinabove with reference to Figs. 2-8.

[30967] VGAM2215 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Ectromelia virus. VGAM2215 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[30968] VGAM2215 gene, herein designated VGAM GENE, encodes a VGAM2215 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2215 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2215 precursor RNA is designated SEQ ID:2201, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2201 is located at position 9138 relative to the genome of Ectromelia virus.

[30969] VGAM2215 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2215 folded precursor RNA, herein designated VGAM FOLDED PRECUR-

SOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[30970] An enzyme complex designated DICER COMPLEX, dices the VGAM2215 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2215 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide sequence of VGAM2215 RNA is designated SEQ ID:4926, and is provided hereinbelow with reference to the sequence listing part.

[30971] VGAM2215 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2215 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2215 host target RNA,

herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[30972] VGAM2215 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2215 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2215 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2215 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2215 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host tar-

get binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[30973] The complementary binding of VGAM2215 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2215 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2215 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2215 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[30974] It is appreciated that VGAM2215 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2215 host target genes. The mRNA of each one of this plurality of VGAM2215 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2215 RNA, herein designated VGAM RNA, and which when bound by VGAM2215 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2215 host target proteins.

[30975] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2215 gene, herein designated VGAM GENE, on one or more VGAM2215 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[30976] It is yet further appreciated that a function of VGAM2215 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2215 include diagnosis, prevention and treatment of viral infection by Ectromelia virus. Specific functions, and accordingly utilities, of VGAM2215 corre-

late with, and may be deduced from, the identity of the host target genes which VGAM2215 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[30977] Nucleotide sequences of the VGAM2215 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2215 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2215 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2215 are further described hereinbelow with reference to Table 1.

[30978] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2215 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[30979] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2216 (VGAM2216) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the

art.

[30980] VGAM2216 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2216 was detected is described hereinabove with reference to Figs. 2-8.

[30981] VGAM2216 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Ectromelia virus. VGAM2216 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[30982] VGAM2216 gene, herein designated VGAM GENE, encodes a VGAM2216 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2216 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2216 precursor RNA is designated SEQ ID:2202, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2202 is located at position 192667 relative to the genome of Ectromelia virus.

[30983] VGAM2216 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2216 folded

precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[30984] An enzyme complex designated DICER COMPLEX, dices the VGAM2216 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2216 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 46%) nucleotide sequence of VGAM2216 RNA is designated SEQ ID:4927, and is provided hereinbelow with reference to the sequence listing part.

[30985] VGAM2216 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2216 host target RNA, herein designated

VGAM HOST TARGET RNA. VGAM2216 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[30986] VGAM2216 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2216 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2216 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2216 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2216 host target RNA, herein designated VGAM HOST TARGET RNA.

It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[30987] The complementary binding of VGAM2216 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2216 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2216 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2216 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[30988] It is appreciated that VGAM2216 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2216 host target genes. The mRNA of each one of this plurality of VGAM2216 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2216 RNA, herein designated VGAM RNA, and which when bound by VGAM2216 RNA, herein designated VGAM RNA, causes inhibition of translation of

respective one or more VGAM2216 host target proteins.

[30989] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2216 gene, herein designated VGAM GENE, on one or more VGAM2216 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[30990] It is yet further appreciated that a function of VGAM2216 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2216 include diagnosis, prevention and treatment of viral infection by Ectromelia virus. Specific

functions, and accordingly utilities, of VGAM2216 correlate with, and may be deduced from, the identity of the host target genes which VGAM2216 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[30991] Nucleotide sequences of the VGAM2216 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2216 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2216 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2216 are further described hereinbelow with reference to Table 1.

[30992] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2216 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[30993] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2217 (VGAM2217) viral gene, which modulates expression of respective host target genes thereof, the func-

tion and utility of which host target genes is known in the art.

[30994] VGAM2217 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2217 was detected is described hereinabove with reference to Figs. 2-8.

[30995] VGAM2217 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Ectromelia virus. VGAM2217 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[30996] VGAM2217 gene, herein designated VGAM GENE, encodes a VGAM2217 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2217 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2217 precursor RNA is designated SEQ ID:2203, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2203 is located at position 198184 relative to the genome of Ectromelia virus.

[30997] VGAM2217 precursor RNA, herein designated VGAM PRE-

CURSOR RNA, folds onto itself, forming VGAM2217 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[30998] An enzyme complex designated DICER COMPLEX, dices the VGAM2217 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2217 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM2217 RNA is designated SEQ ID:4928, and is provided hereinbelow with reference to the sequence listing part.

[30999] VGAM2217 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger

RNA, VGAM2217 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2217 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[31000] VGAM2217 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2217 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2217 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2217 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2217 host

target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[31001] The complementary binding of VGAM2217 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2217 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2217 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2217 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[31002] It is appreciated that VGAM2217 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2217 host target genes. The mRNA of each one of this plurality of VGAM2217 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2217 RNA, herein designated VGAM RNA, and which when bound by VGAM2217 RNA, herein

designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2217 host target proteins.

[31003] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2217 gene, herein designated VGAM GENE, on one or more VGAM2217 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[31004] It is yet further appreciated that a function of VGAM2217 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2217 include diagnosis, prevention and

treatment of viral infection by Ectromelia virus. Specific functions, and accordingly utilities, of VGAM2217 correlate with, and may be deduced from, the identity of the host target genes which VGAM2217 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[31005] Nucleotide sequences of the VGAM2217 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2217 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2217 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2217 are further described hereinbelow with reference to Table 1.

[31006] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2217 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[31007] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2218 (VGAM2218) viral gene, which modulates ex-

pression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[31008] VGAM2218 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2218 was detected is described hereinabove with reference to Figs. 2-8.

[31009] VGAM2218 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Ectromelia virus. VGAM2218 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[31010] VGAM2218 gene, herein designated VGAM GENE, encodes a VGAM2218 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2218 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2218 precursor RNA is designated SEQ ID:2204, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2204 is located at position 188178 relative to the genome of Ectromelia virus.

[31011] VGAM2218 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2218 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[31012] An enzyme complex designated DICER COMPLEX, dices the VGAM2218 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2218 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM2218 RNA is designated SEQ ID:4929, and is provided hereinbelow with reference to the sequence listing part.

[31013] VGAM2218 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2218 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2218 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[31014] VGAM2218 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2218 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2218 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2218 RNA, herein designated VGAM RNA, may have a different number of host target

binding sites in untranslated regions of a VGAM2218 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[31015] The complementary binding of VGAM2218 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2218 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2218 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2218 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[31016] It is appreciated that VGAM2218 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2218 host target genes. The mRNA of each one of this plurality of VGAM2218 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2218 RNA, herein designated VGAM

RNA, and which when bound by VGAM2218 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2218 host target proteins.

[31017] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2218 gene, herein designated VGAM GENE, on one or more VGAM2218 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[31018] It is yet further appreciated that a function of VGAM2218 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly,

utilities of VGAM2218 include diagnosis, prevention and treatment of viral infection by Ectromelia virus. Specific functions, and accordingly utilities, of VGAM2218 correlate with, and may be deduced from, the identity of the host target genes which VGAM2218 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[31019] Nucleotide sequences of the VGAM2218 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2218 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2218 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2218 are further described hereinbelow with reference to Table 1.

[31020] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2218 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[31021] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Mes-

senger 2219 (VGAM2219) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[31022] VGAM2219 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2219 was detected is described hereinabove with reference to Figs. 2-8.

[31023] VGAM2219 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Ectromelia virus. VGAM2219 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[31024] VGAM2219 gene, herein designated VGAM GENE, encodes a VGAM2219 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2219 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2219 precursor RNA is designated SEQ ID:2205, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2205 is located at position

190763 relative to the genome of Ectromelia virus.

[31025] VGAM2219 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2219 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[31026] An enzyme complex designated DICER COMPLEX, dices the VGAM2219 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2219 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 51%) nucleotide sequence of VGAM2219 RNA is designated SEQ ID:4930, and is provided hereinbelow with reference to the sequence listing part.

[31027] VGAM2219 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2219 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2219 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[31028] VGAM2219 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2219 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2219 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2219 RNA, herein designated

VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2219 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[31029] The complementary binding of VGAM2219 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2219 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2219 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2219 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[31030] It is appreciated that VGAM2219 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2219 host target genes. The mRNA of each one of this plurality of VGAM2219 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly com-

plementary to VGAM2219 RNA, herein designated VGAM RNA, and which when bound by VGAM2219 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2219 host target proteins.

[31031] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2219 gene, herein designated VGAM GENE, on one or more VGAM2219 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[31032] It is yet further appreciated that a function of VGAM2219 is inhibition of expression of host target genes, as part of

a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2219 include diagnosis, prevention and treatment of viral infection by Ectromelia virus. Specific functions, and accordingly utilities, of VGAM2219 correlate with, and may be deduced from, the identity of the host target genes which VGAM2219 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[31033] Nucleotide sequences of the VGAM2219 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2219 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2219 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2219 are further described hereinbelow with reference to Table 1.

[31034] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2219 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[31035] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present

invention, referred to here as Viral Genomic Address Messenger 2220 (VGAM2220) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[31036] VGAM2220 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2220 was detected is described hereinabove with reference to Figs. 2-8.

[31037] VGAM2220 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Ectromelia virus. VGAM2220 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[31038] VGAM2220 gene, herein designated VGAM GENE, encodes a VGAM2220 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2220 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2220 precursor RNA is designated SEQ ID:2206, and is provided hereinbelow with reference to the sequence listing part. Nu-

cleotide sequence SEQ ID:2206 is located at position 196292 relative to the genome of Ectromelia virus.

[31039] VGAM2220 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2220 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[31040] An enzyme complex designated DICER COMPLEX, dices the VGAM2220 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2220 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM2220 RNA is designated SEQ ID:4931, and is provided hereinbelow with reference to the sequence

listing part.

[31041] VGAM2220 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2220 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2220 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[31042] VGAM2220 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2220 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2220 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not

meant to be limiting VGAM2220 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2220 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[31043] The complementary binding of VGAM2220 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2220 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2220 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2220 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[31044] It is appreciated that VGAM2220 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2220 host target genes. The mRNA of each one of this plurality of VGAM2220 host target genes comprises one or more host target binding sites, each

having a nucleotide sequence which is at least partly complementary to VGAM2220 RNA, herein designated VGAM RNA, and which when bound by VGAM2220 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2220 host target proteins.

[31045] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2220 gene, herein designated VGAM GENE, on one or more VGAM2220 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[31046] It is yet further appreciated that a function of VGAM2220

is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2220 include diagnosis, prevention and treatment of viral infection by Ectromelia virus. Specific functions, and accordingly utilities, of VGAM2220 correlate with, and may be deduced from, the identity of the host target genes which VGAM2220 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[31047] Nucleotide sequences of the VGAM2220 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2220 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2220 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2220 are further described hereinbelow with reference to Table 1.

[31048] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2220 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[31049] Fig. 1 further provides a conceptual description of another

novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2221 (VGAM2221) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[31050] VGAM2221 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2221 was detected is described hereinabove with reference to Figs. 2-8.

[31051] VGAM2221 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Equine herpesvirus 2. VGAM2221 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[31052] VGAM2221 gene, herein designated VGAM GENE, encodes a VGAM2221 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2221 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2221 precursor RNA is designated SEQ ID:2207, and is provided here-

inbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2207 is located at position 161928 relative to the genome of Equine herpesvirus 2.

[31053] VGAM2221 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2221 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[31054] An enzyme complex designated DICER COMPLEX, dices the VGAM2221 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2221 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of VGAM2221 RNA is designated SEQ ID:4932, and

is provided hereinbelow with reference to the sequence listing part.

[31055] VGAM2221 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2221 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2221 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[31056] VGAM2221 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2221 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2221 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites

shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2221 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2221 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[31057] The complementary binding of VGAM2221 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2221 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2221 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2221 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[31058] It is appreciated that VGAM2221 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2221 host target genes. The mRNA of each one of this plurality of VGAM2221 host target genes

comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2221 RNA, herein designated VGAM RNA, and which when bound by VGAM2221 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2221 host target proteins.

[31059] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2221 gene, herein designated VGAM GENE, on one or more VGAM2221 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[31060] It is yet further appreciated that a function of VGAM2221 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2221 include diagnosis, prevention and treatment of viral infection by Equine herpesvirus 2. Specific functions, and accordingly utilities, of VGAM2221 correlate with, and may be deduced from, the identity of the host target genes which VGAM2221 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[31061] Nucleotide sequences of the VGAM2221 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2221 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2221 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2221 are further described hereinbelow with reference to Table 1.

[31062] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2221 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[31063] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2222 (VGAM2222) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[31064] VGAM2222 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2222 was detected is described hereinabove with reference to Figs. 2-8.

[31065] VGAM2222 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Equine herpesvirus 2. VGAM2222 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[31066] VGAM2222 gene, herein designated VGAM GENE, encodes a VGAM2222 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2222 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2222 precur-

sor RNA is designated SEQ ID:2208, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2208 is located at position 11521 relative to the genome of Equine herpesvirus 2.

[31067] VGAM2222 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2222 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[31068] An enzyme complex designated DICER COMPLEX, dices the VGAM2222 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2222 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 61%) nucleotide se-

quence of VGAM2222 RNA is designated SEQ ID:4933, and is provided hereinbelow with reference to the sequence listing part.

[31069] VGAM2222 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2222 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2222 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[31070] VGAM2222 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2222 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2222 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is ap-

preciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2222 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2222 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[31071] The complementary binding of VGAM2222 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2222 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2222 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2222 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[31072] It is appreciated that VGAM2222 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2222 host target genes. The mRNA of

each one of this plurality of VGAM2222 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2222 RNA, herein designated VGAM RNA, and which when bound by VGAM2222 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2222 host target proteins.

[31073] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2222 gene, herein designated VGAM GENE, on one or more VGAM2222 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science

294,779 (2001)).

[31074] It is yet further appreciated that a function of VGAM2222 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2222 include diagnosis, prevention and treatment of viral infection by Equine herpesvirus 2. Specific functions, and accordingly utilities, of VGAM2222 correlate with, and may be deduced from, the identity of the host target genes which VGAM2222 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[31075] Nucleotide sequences of the VGAM2222 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2222 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2222 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2222 are further described hereinbelow with reference to Table 1.

[31076] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2222 RNA, herein designated VGAM RNA, are de-

scribed hereinbelow with reference to Table 2.

[31077] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2223 (VGAM2223) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[31078] VGAM2223 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2223 was detected is described hereinabove with reference to Figs. 2-8.

[31079] VGAM2223 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Equine herpesvirus 2. VGAM2223 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[31080] VGAM2223 gene, herein designated VGAM GENE, encodes a VGAM2223 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2223 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly

similar to the nucleotide sequence of VGAM2223 precursor RNA is designated SEQ ID:2209, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2209 is located at position 2065 relative to the genome of Equine herpesvirus 2.

[31081] VGAM2223 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2223 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[31082] An enzyme complex designated DICER COMPLEX, dices the VGAM2223 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2223 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other

necessary proteins. A probable (over 47%) nucleotide sequence of VGAM2223 RNA is designated SEQ ID:4934, and is provided hereinbelow with reference to the sequence listing part.

[31083] VGAM2223 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2223 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2223 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[31084] VGAM2223 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2223 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2223 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I,

BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2223 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2223 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[31085] The complementary binding of VGAM2223 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2223 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2223 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2223 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[31086] It is appreciated that VGAM2223 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents

a plurality of VGAM2223 host target genes. The mRNA of each one of this plurality of VGAM2223 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2223 RNA, herein designated VGAM RNA, and which when bound by VGAM2223 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2223 host target proteins.

[31087] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2223 gene, herein designated VGAM GENE, on one or more VGAM2223 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[31088] It is yet further appreciated that a function of VGAM2223 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2223 include diagnosis, prevention and treatment of viral infection by Equine herpesvirus 2. Specific functions, and accordingly utilities, of VGAM2223 correlate with, and may be deduced from, the identity of the host target genes which VGAM2223 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[31089] Nucleotide sequences of the VGAM2223 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2223 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2223 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2223 are further described hereinbelow with reference to Table 1.

[31090] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites

to VGAM2223 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[31091] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2224 (VGAM2224) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[31092] VGAM2224 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2224 was detected is described hereinabove with reference to Figs. 2-8.

[31093] VGAM2224 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Equine herpesvirus 2. VGAM2224 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[31094] VGAM2224 gene, herein designated VGAM GENE, encodes a VGAM2224 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2224 precursor RNA, herein designated VGAM PRECURSOR RNA, does not en-

code a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2224 precursor RNA is designated SEQ ID:2210, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2210 is located at position 2628 relative to the genome of Equine herpesvirus 2.

[31095] VGAM2224 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2224 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[31096] An enzyme complex designated DICER COMPLEX, dices the VGAM2224 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2224 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer together with other necessary proteins. A probable (over 52%) nucleotide sequence of VGAM2224 RNA is designated SEQ ID:4935, and is provided hereinbelow with reference to the sequence listing part.

[31097] VGAM2224 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2224 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2224 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[31098] VGAM2224 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2224 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2224 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3

such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2224 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2224 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[31099] The complementary binding of VGAM2224 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2224 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2224 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2224 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[31100] It is appreciated that VGAM2224 host target gene, herein

designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2224 host target genes. The mRNA of each one of this plurality of VGAM2224 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2224 RNA, herein designated VGAM RNA, and which when bound by VGAM2224 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2224 host target proteins.

[31101] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2224 gene, herein designated VGAM GENE, on one or more VGAM2224 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these

other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[31102] It is yet further appreciated that a function of VGAM2224 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2224 include diagnosis, prevention and treatment of viral infection by Equine herpesvirus 2. Specific functions, and accordingly utilities, of VGAM2224 correlate with, and may be deduced from, the identity of the host target genes which VGAM2224 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[31103] Nucleotide sequences of the VGAM2224 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2224 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2224 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2224 are further described hereinbelow with reference to Table 1.

[31104] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the

complementarity of each of these host target binding sites to VGAM2224 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[31105] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2225 (VGAM2225) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[31106] VGAM2225 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2225 was detected is described hereinabove with reference to Figs. 2-8.

[31107] VGAM2225 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Equine herpesvirus 2. VGAM2225 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[31108] VGAM2225 gene, herein designated VGAM GENE, encodes a VGAM2225 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2225 precursor RNA,

herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2225 precursor RNA is designated SEQ ID:2211, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2211 is located at position 9536 relative to the genome of Equine herpesvirus 2.

[31109] VGAM2225 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2225 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[31110] An enzyme complex designated DICER COMPLEX, dices the VGAM2225 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2225 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short

~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 45%) nucleotide sequence of VGAM2225 RNA is designated SEQ ID:4936, and is provided hereinbelow with reference to the sequence listing part.

[31111] VGAM2225 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2225 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2225 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[31112] VGAM2225 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2225 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2225 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host

target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2225 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2225 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[31113] The complementary binding of VGAM2225 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2225 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2225 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2225 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[31114] It is appreciated that VGAM2225 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2225 host target genes. The mRNA of each one of this plurality of VGAM2225 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2225 RNA, herein designated VGAM RNA, and which when bound by VGAM2225 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2225 host target proteins.

[31115] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2225 gene, herein designated VGAM GENE, on one or more VGAM2225 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, al-

though specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[31116] It is yet further appreciated that a function of VGAM2225 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2225 include diagnosis, prevention and treatment of viral infection by Equine herpesvirus 2. Specific functions, and accordingly utilities, of VGAM2225 correlate with, and may be deduced from, the identity of the host target genes which VGAM2225 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[31117] Nucleotide sequences of the VGAM2225 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2225 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2225 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2225 are further described hereinbelow with reference to Table 1.

[31118] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of

Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2225 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[31119] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2226 (VGAM2226) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[31120] VGAM2226 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2226 was detected is described hereinabove with reference to Figs. 2-8.

[31121] VGAM2226 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Equine herpesvirus 2. VGAM2226 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[31122] VGAM2226 gene, herein designated VGAM GENE, encodes a VGAM2226 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and un-

like most ordinary genes, VGAM2226 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2226 precursor RNA is designated SEQ ID:2212, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2212 is located at position 161798 relative to the genome of Equine herpesvirus 2.

[31123] VGAM2226 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2226 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[31124] An enzyme complex designated DICER COMPLEX, dices the VGAM2226 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2226 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a

hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide sequence of VGAM2226 RNA is designated SEQ ID:4937, and is provided hereinbelow with reference to the sequence listing part.

[31125] VGAM2226 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2226 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2226 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[31126] VGAM2226 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2226 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2226 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed

sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2226 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2226 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[31127] The complementary binding of VGAM2226 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2226 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2226 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2226 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target

protein is therefore outlined by a broken line.

[31128] It is appreciated that VGAM2226 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2226 host target genes. The mRNA of each one of this plurality of VGAM2226 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2226 RNA, herein designated VGAM RNA, and which when bound by VGAM2226 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2226 host target proteins.

[31129] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2226 gene, herein designated VGAM GENE, on one or more VGAM2226 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate ex-

pression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[31130] It is yet further appreciated that a function of VGAM2226 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2226 include diagnosis, prevention and treatment of viral infection by Equine herpesvirus 2. Specific functions, and accordingly utilities, of VGAM2226 correlate with, and may be deduced from, the identity of the host target genes which VGAM2226 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[31131] Nucleotide sequences of the VGAM2226 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2226 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2226 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2226 are further described hereinbelow with reference to Table 1.

[31132] Nucleotide sequences of host target binding sites, such as

BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2226 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[31133] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2227 (VGAM2227) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[31134] VGAM2227 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2227 was detected is described hereinabove with reference to Figs. 2-8.

[31135] VGAM2227 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Equine herpesvirus 2. VGAM2227 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[31136] VGAM2227 gene, herein designated VGAM GENE, encodes a VGAM2227 precursor RNA, herein designated VGAM

PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2227 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2227 precursor RNA is designated SEQ ID:2213, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2213 is located at position 161250 relative to the genome of Equine herpesvirus 2.

[31137] VGAM2227 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2227 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[31138] An enzyme complex designated DICER COMPLEX, dices the VGAM2227 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2227 RNA, herein designated VGAM RNA, a single stranded ~22 nt

long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM2227 RNA is designated SEQ ID:4938, and is provided hereinbelow with reference to the sequence listing part.

[31139] VGAM2227 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2227 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2227 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[31140] VGAM2227 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2227 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2227 RNA, herein designated

VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2227 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2227 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[31141] The complementary binding of VGAM2227 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2227 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2227 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2227 host target protein, herein desig-

nated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[31142] It is appreciated that VGAM2227 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2227 host target genes. The mRNA of each one of this plurality of VGAM2227 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2227 RNA, herein designated VGAM RNA, and which when bound by VGAM2227 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2227 host target proteins.

[31143] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2227 gene, herein designated VGAM GENE, on one or more VGAM2227 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are

also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[31144] It is yet further appreciated that a function of VGAM2227 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2227 include diagnosis, prevention and treatment of viral infection by Equine herpesvirus 2. Specific functions, and accordingly utilities, of VGAM2227 correlate with, and may be deduced from, the identity of the host target genes which VGAM2227 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[31145] Nucleotide sequences of the VGAM2227 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2227 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2227 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2227 are further described hereinbelow with reference to Table 1.

[31146] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2227 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[31147] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2228 (VGAM2228) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[31148] VGAM2228 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2228 was detected is described hereinabove with reference to Figs. 2-8.

[31149] VGAM2228 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Equine herpesvirus 2. VGAM2228 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[31150] VGAM2228 gene, herein designated VGAM GENE, encodes

a VGAM2228 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2228 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2228 precursor RNA is designated SEQ ID:2214, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2214 is located at position 162465 relative to the genome of Equine herpesvirus 2.

[31151] VGAM2228 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2228 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[31152] An enzyme complex designated DICER COMPLEX, dices the VGAM2228 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2228 RNA,

herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM2228 RNA is designated SEQ ID:4939, and is provided hereinbelow with reference to the sequence listing part.

[31153] VGAM2228 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2228 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2228 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[31154] VGAM2228 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2228 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nu-

cleotide sequence of VGAM2228 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2228 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2228 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[31155] The complementary binding of VGAM2228 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2228 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2228 host target RNA, herein designated VGAM HOST TARGET

RNA, into VGAM2228 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[31156] It is appreciated that VGAM2228 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2228 host target genes. The mRNA of each one of this plurality of VGAM2228 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2228 RNA, herein designated VGAM RNA, and which when bound by VGAM2228 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2228 host target proteins.

[31157] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2228 gene, herein designated VGAM GENE, on one or more VGAM2228 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4

and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[31158] It is yet further appreciated that a function of VGAM2228 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2228 include diagnosis, prevention and treatment of viral infection by Equine herpesvirus 2. Specific functions, and accordingly utilities, of VGAM2228 correlate with, and may be deduced from, the identity of the host target genes which VGAM2228 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[31159] Nucleotide sequences of the VGAM2228 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2228 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2228 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2228 are further

described hereinbelow with reference to Table 1.

[31160] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2228 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[31161] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2229 (VGAM2229) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[31162] VGAM2229 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2229 was detected is described hereinabove with reference to Figs. 2-8.

[31163] VGAM2229 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Potato aucuba mosaic virus. VGAM2229 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[31164] VGAM2229 gene, herein designated VGAM GENE, encodes a VGAM2229 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2229 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2229 precursor RNA is designated SEQ ID:2215, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2215 is located at position 827 relative to the genome of Potato aucuba mosaic virus.

[31165] VGAM2229 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2229 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[31166] An enzyme complex designated DICER COMPLEX, dices the VGAM2229 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, into VGAM2229 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of VGAM2229 RNA is designated SEQ ID:4940, and is provided hereinbelow with reference to the sequence listing part.

[31167] VGAM2229 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2229 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2229 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[31168] VGAM2229 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2229 host target RNA, herein designated VGAM HOST TARGET RNA. This

complementary binding is due to the fact that the nucleotide sequence of VGAM2229 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2229 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2229 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[31169] The complementary binding of VGAM2229 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2229 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2229

host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2229 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[31170] It is appreciated that VGAM2229 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2229 host target genes. The mRNA of each one of this plurality of VGAM2229 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2229 RNA, herein designated VGAM RNA, and which when bound by VGAM2229 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2229 host target proteins.

[31171] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2229 gene, herein designated VGAM GENE, on one or more VGAM2229 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated

only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[31172] It is yet further appreciated that a function of VGAM2229 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2229 include diagnosis, prevention and treatment of viral infection by Potato aucuba mosaic virus. Specific functions, and accordingly utilities, of VGAM2229 correlate with, and may be deduced from, the identity of the host target genes which VGAM2229 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[31173] Nucleotide sequences of the VGAM2229 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2229 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2229 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, of VGAM2229 are further described hereinbelow with reference to Table 1.

[31174] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2229 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[31175] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2230 (VGAM2230) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[31176] VGAM2230 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2230 was detected is described hereinabove with reference to Figs. 2-8.

[31177] VGAM2230 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Potato aucuba mosaic virus. VGAM2230 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in

the human genome.

[31178] VGAM2230 gene, herein designated VGAM GENE, encodes a VGAM2230 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2230 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2230 precursor RNA is designated SEQ ID:2216, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2216 is located at position 1300 relative to the genome of Potato aucuba mosaic virus.

[31179] VGAM2230 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2230 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[31180] An enzyme complex designated DICER COMPLEX, dices

the VGAM2230 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2230 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide sequence of VGAM2230 RNA is designated SEQ ID:4941, and is provided hereinbelow with reference to the sequence listing part.

[31181] VGAM2230 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2230 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2230 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[31182] VGAM2230 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2230 host target

RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2230 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2230 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2230 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[31183] The complementary binding of VGAM2230 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2230 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE

II and BINDING SITE III, inhibits translation of VGAM2230 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2230 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[31184] It is appreciated that VGAM2230 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2230 host target genes. The mRNA of each one of this plurality of VGAM2230 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2230 RNA, herein designated VGAM RNA, and which when bound by VGAM2230 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2230 host target proteins.

[31185] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2230 gene, herein designated VGAM GENE, on one or more VGAM2230 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a spe-

cific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[31186] It is yet further appreciated that a function of VGAM2230 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2230 include diagnosis, prevention and treatment of viral infection by Potato aucuba mosaic virus. Specific functions, and accordingly utilities, of VGAM2230 correlate with, and may be deduced from, the identity of the host target genes which VGAM2230 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[31187] Nucleotide sequences of the VGAM2230 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2230 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of

VGAM2230 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2230 are further described hereinbelow with reference to Table 1.

[31188] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2230 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[31189] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2231 (VGAM2231) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[31190] VGAM2231 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2231 was detected is described hereinabove with reference to Figs. 2-8.

[31191] VGAM2231 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Potato aucuba mosaic virus. VGAM2231 host target gene, herein designated

VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[31192] VGAM2231 gene, herein designated VGAM GENE, encodes a VGAM2231 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2231 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2231 precursor RNA is designated SEQ ID:2217, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2217 is located at position 1079 relative to the genome of Potato aucuba mosaic virus.

[31193] VGAM2231 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2231 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[31194] An enzyme complex designated DICER COMPLEX, dices the VGAM2231 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2231 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM2231 RNA is designated SEQ ID:4942, and is provided hereinbelow with reference to the sequence listing part.

[31195] VGAM2231 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2231 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2231 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[31196] VGAM2231 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites

located in untranslated regions of VGAM2231 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2231 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2231 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2231 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[31197] The complementary binding of VGAM2231 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2231 host target RNA, herein designated VGAM

HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2231 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2231 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[31198] It is appreciated that VGAM2231 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2231 host target genes. The mRNA of each one of this plurality of VGAM2231 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2231 RNA, herein designated VGAM RNA, and which when bound by VGAM2231 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2231 host target proteins.

[31199] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2231 gene, herein designated VGAM GENE, on one or more VGAM2231 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove

with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[31200] It is yet further appreciated that a function of VGAM2231 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2231 include diagnosis, prevention and treatment of viral infection by Potato aucuba mosaic virus. Specific functions, and accordingly utilities, of VGAM2231 correlate with, and may be deduced from, the identity of the host target genes which VGAM2231 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[31201] Nucleotide sequences of the VGAM2231 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2231 RNA, herein designated VGAM RNA, and

a schematic representation of the secondary folding of VGAM2231 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2231 are further described hereinbelow with reference to Table 1.

[31202] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2231 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[31203] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2232 (VGAM2232) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[31204] VGAM2232 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2232 was detected is described hereinabove with reference to Figs. 2-8.

[31205] VGAM2232 gene, herein designated VGAM GENE, is a viral gene contained in the genome of porcine epidemic diar-

rhea virus. VGAM2232 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[31206] VGAM2232 gene, herein designated VGAM GENE, encodes a VGAM2232 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2232 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2232 precursor RNA is designated SEQ ID:2218, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2218 is located at position 2170 relative to the genome of porcine epidemic diarrhea virus.

[31207] VGAM2232 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2232 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of

the second half thereof.

[31208] An enzyme complex designated DICER COMPLEX, dices the VGAM2232 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2232 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 46%) nucleotide sequence of VGAM2232 RNA is designated SEQ ID:4943, and is provided hereinbelow with reference to the sequence listing part.

[31209] VGAM2232 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2232 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2232 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[31210] VGAM2232 RNA, herein designated VGAM RNA, binds

complementarily to one or more host target binding sites located in untranslated regions of VGAM2232 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2232 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2232 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2232 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[31211] The complementary binding of VGAM2232 RNA, herein designated VGAM RNA, to host target binding sites on

VGAM2232 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2232 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2232 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[31212] It is appreciated that VGAM2232 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2232 host target genes. The mRNA of each one of this plurality of VGAM2232 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2232 RNA, herein designated VGAM RNA, and which when bound by VGAM2232 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2232 host target proteins.

[31213] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2232 gene, herein designated VGAM GENE, on one or more VGAM2232 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other

known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[31214] It is yet further appreciated that a function of VGAM2232 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2232 include diagnosis, prevention and treatment of viral infection by porcine epidemic diarrhea virus. Specific functions, and accordingly utilities, of VGAM2232 correlate with, and may be deduced from, the identity of the host target genes which VGAM2232 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[31215] Nucleotide sequences of the VGAM2232 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the

diced VGAM2232 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2232 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2232 are further described hereinbelow with reference to Table 1.

[31216] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2232 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[31217] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2233 (VGAM2233) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[31218] VGAM2233 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2233 was detected is described hereinabove with reference to Figs. 2-8.

[31219] VGAM2233 gene, herein designated VGAM GENE, is a viral

gene contained in the genome of porcine epidemic diarrhea virus. VGAM2233 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[31220] VGAM2233 gene, herein designated VGAM GENE, encodes a VGAM2233 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2233 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2233 precursor RNA is designated SEQ ID:2219, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2219 is located at position 17365 relative to the genome of porcine epidemic diarrhea virus.

[31221] VGAM2233 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2233 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the

RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[31222] An enzyme complex designated DICER COMPLEX, dices the VGAM2233 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2233 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM2233 RNA is designated SEQ ID:4944, and is provided hereinbelow with reference to the sequence listing part.

[31223] VGAM2233 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2233 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2233 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN COD-

ING and 3UTR respectively.

[31224] VGAM2233 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2233 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2233 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2233 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2233 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[31225] The complementary binding of VGAM2233 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2233 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2233 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2233 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[31226] It is appreciated that VGAM2233 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2233 host target genes. The mRNA of each one of this plurality of VGAM2233 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2233 RNA, herein designated VGAM RNA, and which when bound by VGAM2233 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2233 host target proteins.

[31227] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2233 gene, herein designated VGAM GENE, on one

or more VGAM2233 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[31228] It is yet further appreciated that a function of VGAM2233 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2233 include diagnosis, prevention and treatment of viral infection by porcine epidemic diarrhea virus. Specific functions, and accordingly utilities, of VGAM2233 correlate with, and may be deduced from, the identity of the host target genes which VGAM2233 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[31229] Nucleotide sequences of the VGAM2233 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2233 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2233 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2233 are further described hereinbelow with reference to Table 1.

[31230] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2233 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[31231] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2234 (VGAM2234) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[31232] VGAM2234 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2234 was detected is de-

scribed hereinabove with reference to Figs. 2-8.

[31233] VGAM2234 gene, herein designated VGAM GENE, is a viral gene contained in the genome of porcine epidemic diarrhea virus. VGAM2234 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[31234] VGAM2234 gene, herein designated VGAM GENE, encodes a VGAM2234 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2234 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2234 precursor RNA is designated SEQ ID:2220, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2220 is located at position 15172 relative to the genome of porcine epidemic diarrhea virus.

[31235] VGAM2234 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2234 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typi-

cal of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[31236] An enzyme complex designated DICER COMPLEX, dices the VGAM2234 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2234 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM2234 RNA is designated SEQ ID:4945, and is provided hereinbelow with reference to the sequence listing part.

[31237] VGAM2234 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2234 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2234 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding

gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[31238] VGAM2234 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2234 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2234 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2234 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2234 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be lo-

cated in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[31239] The complementary binding of VGAM2234 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2234 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2234 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2234 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[31240] It is appreciated that VGAM2234 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2234 host target genes. The mRNA of each one of this plurality of VGAM2234 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2234 RNA, herein designated VGAM RNA, and which when bound by VGAM2234 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2234 host target proteins.

[31241] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with

specific reference to translational inhibition exerted by VGAM2234 gene, herein designated VGAM GENE, on one or more VGAM2234 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[31242] It is yet further appreciated that a function of VGAM2234 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2234 include diagnosis, prevention and treatment of viral infection by porcine epidemic diarrhea virus. Specific functions, and accordingly utilities, of VGAM2234 correlate with, and may be deduced from, the identity of the host target genes which VGAM2234 binds

and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[31243] Nucleotide sequences of the VGAM2234 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2234 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2234 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2234 are further described hereinbelow with reference to Table 1.

[31244] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2234 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[31245] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2235 (VGAM2235) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[31246] VGAM2235 is a novel bioinformatically detected regula-

tory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2235 was detected is described hereinabove with reference to Figs. 2-8.

[31247] VGAM2235 gene, herein designated VGAM GENE, is a viral gene contained in the genome of porcine epidemic diarrhea virus. VGAM2235 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[31248] VGAM2235 gene, herein designated VGAM GENE, encodes a VGAM2235 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2235 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2235 precursor RNA is designated SEQ ID:2221, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2221 is located at position 19252 relative to the genome of porcine epidemic diarrhea virus.

[31249] VGAM2235 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2235 folded precursor RNA, herein designated VGAM FOLDED PRECUR-

SOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[31250] An enzyme complex designated DICER COMPLEX, dices the VGAM2235 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2235 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM2235 RNA is designated SEQ ID:4946, and is provided hereinbelow with reference to the sequence listing part.

[31251] VGAM2235 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2235 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2235 host target RNA,

herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[31252] VGAM2235 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2235 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2235 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2235 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2235 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host tar-

get binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[31253] The complementary binding of VGAM2235 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2235 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2235 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2235 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[31254] It is appreciated that VGAM2235 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2235 host target genes. The mRNA of each one of this plurality of VGAM2235 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2235 RNA, herein designated VGAM RNA, and which when bound by VGAM2235 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2235 host target proteins.

[31255] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2235 gene, herein designated VGAM GENE, on one or more VGAM2235 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[31256] It is yet further appreciated that a function of VGAM2235 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2235 include diagnosis, prevention and treatment of viral infection by porcine epidemic diarrhea virus. Specific functions, and accordingly utilities, of

VGAM2235 correlate with, and may be deduced from, the identity of the host target genes which VGAM2235 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[31257] Nucleotide sequences of the VGAM2235 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2235 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2235 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2235 are further described hereinbelow with reference to Table 1.

[31258] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2235 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[31259] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2236 (VGAM2236) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the

art.

[31260] VGAM2236 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2236 was detected is described hereinabove with reference to Figs. 2-8.

[31261] VGAM2236 gene, herein designated VGAM GENE, is a viral gene contained in the genome of porcine epidemic diarrhea virus. VGAM2236 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[31262] VGAM2236 gene, herein designated VGAM GENE, encodes a VGAM2236 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2236 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2236 precursor RNA is designated SEQ ID:2222, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2222 is located at position 3556 relative to the genome of porcine epidemic diarrhea virus.

[31263] VGAM2236 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2236 folded

precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[31264] An enzyme complex designated DICER COMPLEX, dices the VGAM2236 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2236 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 66%) nucleotide sequence of VGAM2236 RNA is designated SEQ ID:4947, and is provided hereinbelow with reference to the sequence listing part.

[31265] VGAM2236 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2236 host target RNA, herein designated

VGAM HOST TARGET RNA. VGAM2236 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[31266] VGAM2236 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2236 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2236 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2236 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2236 host target RNA, herein designated VGAM HOST TARGET RNA.

It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[31267] The complementary binding of VGAM2236 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2236 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2236 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2236 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[31268] It is appreciated that VGAM2236 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2236 host target genes. The mRNA of each one of this plurality of VGAM2236 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2236 RNA, herein designated VGAM RNA, and which when bound by VGAM2236 RNA, herein designated VGAM RNA, causes inhibition of translation of

respective one or more VGAM2236 host target proteins.

[31269] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2236 gene, herein designated VGAM GENE, on one or more VGAM2236 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[31270] It is yet further appreciated that a function of VGAM2236 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2236 include diagnosis, prevention and treatment of viral infection by porcine epidemic diarrhea

virus. Specific functions, and accordingly utilities, of VGAM2236 correlate with, and may be deduced from, the identity of the host target genes which VGAM2236 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[31271] Nucleotide sequences of the VGAM2236 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2236 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2236 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2236 are further described hereinbelow with reference to Table 1.

[31272] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2236 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[31273] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2237 (VGAM2237) viral gene, which modulates expression of respective host target genes thereof, the func-

tion and utility of which host target genes is known in the art.

[31274] VGAM2237 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2237 was detected is described hereinabove with reference to Figs. 2-8.

[31275] VGAM2237 gene, herein designated VGAM GENE, is a viral gene contained in the genome of porcine epidemic diarrhea virus. VGAM2237 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[31276] VGAM2237 gene, herein designated VGAM GENE, encodes a VGAM2237 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2237 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2237 precursor RNA is designated SEQ ID:2223, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2223 is located at position 26770 relative to the genome of porcine epidemic diarrhea virus.

[31277] VGAM2237 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2237 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[31278] An enzyme complex designated DICER COMPLEX, dices the VGAM2237 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2237 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 49%) nucleotide sequence of VGAM2237 RNA is designated SEQ ID:4948, and is provided hereinbelow with reference to the sequence listing part.

[31279] VGAM2237 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2237 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2237 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[31280] VGAM2237 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2237 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2237 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2237 RNA, herein designated VGAM RNA, may have a different number of host target

binding sites in untranslated regions of a VGAM2237 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[31281] The complementary binding of VGAM2237 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2237 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2237 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2237 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[31282] It is appreciated that VGAM2237 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2237 host target genes. The mRNA of each one of this plurality of VGAM2237 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2237 RNA, herein designated VGAM

RNA, and which when bound by VGAM2237 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2237 host target proteins.

[31283] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2237 gene, herein designated VGAM GENE, on one or more VGAM2237 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[31284] It is yet further appreciated that a function of VGAM2237 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly,

utilities of VGAM2237 include diagnosis, prevention and treatment of viral infection by porcine epidemic diarrhea virus. Specific functions, and accordingly utilities, of VGAM2237 correlate with, and may be deduced from, the identity of the host target genes which VGAM2237 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[31285] Nucleotide sequences of the VGAM2237 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2237 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2237 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2237 are further described hereinbelow with reference to Table 1.

[31286] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2237 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[31287] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Mes-

senger 2238 (VGAM2238) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[31288] VGAM2238 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2238 was detected is described hereinabove with reference to Figs. 2-8.

[31289] VGAM2238 gene, herein designated VGAM GENE, is a viral gene contained in the genome of porcine epidemic diarrhea virus. VGAM2238 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[31290] VGAM2238 gene, herein designated VGAM GENE, encodes a VGAM2238 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2238 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2238 precursor RNA is designated SEQ ID:2224, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2224 is located at position 7462

relative to the genome of porcine epidemic diarrhea virus.

[31291] VGAM2238 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2238 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[31292] An enzyme complex designated DICER COMPLEX, dices the VGAM2238 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2238 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM2238 RNA is designated SEQ ID:4949, and is provided hereinbelow with reference to the sequence listing part.

[31293] VGAM2238 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2238 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2238 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[31294] VGAM2238 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2238 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2238 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2238 RNA, herein designated

VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2238 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[31295] The complementary binding of VGAM2238 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2238 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2238 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2238 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[31296] It is appreciated that VGAM2238 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2238 host target genes. The mRNA of each one of this plurality of VGAM2238 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly com-

plementary to VGAM2238 RNA, herein designated VGAM RNA, and which when bound by VGAM2238 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2238 host target proteins.

[31297] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2238 gene, herein designated VGAM GENE, on one or more VGAM2238 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[31298] It is yet further appreciated that a function of VGAM2238 is inhibition of expression of host target genes, as part of

a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2238 include diagnosis, prevention and treatment of viral infection by porcine epidemic diarrhea virus. Specific functions, and accordingly utilities, of VGAM2238 correlate with, and may be deduced from, the identity of the host target genes which VGAM2238 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[31299] Nucleotide sequences of the VGAM2238 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2238 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2238 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2238 are further described hereinbelow with reference to Table 1.

[31300] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2238 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[31301] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present

invention, referred to here as Viral Genomic Address Messenger 2239 (VGAM2239) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[31302] VGAM2239 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2239 was detected is described hereinabove with reference to Figs. 2-8.

[31303] VGAM2239 gene, herein designated VGAM GENE, is a viral gene contained in the genome of porcine epidemic diarrhea virus. VGAM2239 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[31304] VGAM2239 gene, herein designated VGAM GENE, encodes a VGAM2239 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2239 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2239 precursor RNA is designated SEQ ID:2225, and is provided hereinbelow with reference to the sequence listing part. Nu-

cleotide sequence SEQ ID:2225 is located at position 11663 relative to the genome of porcine epidemic diarrhea virus.

[31305] VGAM2239 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2239 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[31306] An enzyme complex designated DICER COMPLEX, dices the VGAM2239 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2239 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 67%) nucleotide sequence of VGAM2239 RNA is designated SEQ ID:4950, and

is provided hereinbelow with reference to the sequence listing part.

[31307] VGAM2239 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2239 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2239 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[31308] VGAM2239 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2239 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2239 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites

shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2239 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2239 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[31309] The complementary binding of VGAM2239 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2239 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2239 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2239 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[31310] It is appreciated that VGAM2239 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2239 host target genes. The mRNA of each one of this plurality of VGAM2239 host target genes

comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2239 RNA, herein designated VGAM RNA, and which when bound by VGAM2239 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2239 host target proteins.

[31311] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2239 gene, herein designated VGAM GENE, on one or more VGAM2239 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[31312] It is yet further appreciated that a function of VGAM2239 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2239 include diagnosis, prevention and treatment of viral infection by porcine epidemic diarrhea virus. Specific functions, and accordingly utilities, of VGAM2239 correlate with, and may be deduced from, the identity of the host target genes which VGAM2239 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[31313] Nucleotide sequences of the VGAM2239 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2239 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2239 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2239 are further described hereinbelow with reference to Table 1.

[31314] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2239 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[31315] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2240 (VGAM2240) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[31316] VGAM2240 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2240 was detected is described hereinabove with reference to Figs. 2-8.

[31317] VGAM2240 gene, herein designated VGAM GENE, is a viral gene contained in the genome of porcine epidemic diarrhea virus. VGAM2240 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[31318] VGAM2240 gene, herein designated VGAM GENE, encodes a VGAM2240 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2240 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2240 precur-

sor RNA is designated SEQ ID:2226, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2226 is located at position 27326 relative to the genome of porcine epidemic diarrhea virus.

[31319] VGAM2240 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2240 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[31320] An enzyme complex designated DICER COMPLEX, dices the VGAM2240 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2240 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other

necessary proteins. A probable (over 77%) nucleotide sequence of VGAM2240 RNA is designated SEQ ID:4951, and is provided hereinbelow with reference to the sequence listing part.

[31321] VGAM2240 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2240 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2240 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[31322] VGAM2240 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2240 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2240 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I,

BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2240 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2240 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[31323] The complementary binding of VGAM2240 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2240 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2240 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2240 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[31324] It is appreciated that VGAM2240 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents

a plurality of VGAM2240 host target genes. The mRNA of each one of this plurality of VGAM2240 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2240 RNA, herein designated VGAM RNA, and which when bound by VGAM2240 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2240 host target proteins.

[31325] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2240 gene, herein designated VGAM GENE, on one or more VGAM2240 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[31326] It is yet further appreciated that a function of VGAM2240 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2240 include diagnosis, prevention and treatment of viral infection by porcine epidemic diarrhea virus. Specific functions, and accordingly utilities, of VGAM2240 correlate with, and may be deduced from, the identity of the host target genes which VGAM2240 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[31327] Nucleotide sequences of the VGAM2240 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2240 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2240 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2240 are further described hereinbelow with reference to Table 1.

[31328] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites

to VGAM2240 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[31329] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2241 (VGAM2241) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[31330] VGAM2241 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2241 was detected is described hereinabove with reference to Figs. 2-8.

[31331] VGAM2241 gene, herein designated VGAM GENE, is a viral gene contained in the genome of porcine epidemic diarrhea virus. VGAM2241 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[31332] VGAM2241 gene, herein designated VGAM GENE, encodes a VGAM2241 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2241 precursor RNA, herein designated VGAM PRECURSOR RNA, does not en-

code a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2241 precursor RNA is designated SEQ ID:2227, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2227 is located at position 14383 relative to the genome of porcine epidemic diarrhea virus.

[31333] VGAM2241 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2241 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[31334] An enzyme complex designated DICER COMPLEX, dices the VGAM2241 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2241 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short

~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 45%) nucleotide sequence of VGAM2241 RNA is designated SEQ ID:4952, and is provided hereinbelow with reference to the sequence listing part.

[31335] VGAM2241 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2241 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2241 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[31336] VGAM2241 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2241 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2241 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host

target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2241 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2241 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[31337] The complementary binding of VGAM2241 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2241 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2241 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2241 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[31338] It is appreciated that VGAM2241 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2241 host target genes. The mRNA of each one of this plurality of VGAM2241 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2241 RNA, herein designated VGAM RNA, and which when bound by VGAM2241 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2241 host target proteins.

[31339] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2241 gene, herein designated VGAM GENE, on one or more VGAM2241 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, al-

though specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[31340] It is yet further appreciated that a function of VGAM2241 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2241 include diagnosis, prevention and treatment of viral infection by porcine epidemic diarrhea virus. Specific functions, and accordingly utilities, of VGAM2241 correlate with, and may be deduced from, the identity of the host target genes which VGAM2241 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[31341] Nucleotide sequences of the VGAM2241 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2241 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2241 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2241 are further described hereinbelow with reference to Table 1.

[31342] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of

Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2241 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[31343] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2242 (VGAM2242) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[31344] VGAM2242 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2242 was detected is described hereinabove with reference to Figs. 2-8.

[31345] VGAM2242 gene, herein designated VGAM GENE, is a viral gene contained in the genome of porcine epidemic diarrhea virus. VGAM2242 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[31346] VGAM2242 gene, herein designated VGAM GENE, encodes a VGAM2242 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and un-

like most ordinary genes, VGAM2242 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2242 precursor RNA is designated SEQ ID:2228, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2228 is located at position 2414 relative to the genome of porcine epidemic diarrhea virus.

[31347] VGAM2242 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2242 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[31348] An enzyme complex designated DICER COMPLEX, dices the VGAM2242 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2242 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a

hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 45%) nucleotide sequence of VGAM2242 RNA is designated SEQ ID:4953, and is provided hereinbelow with reference to the sequence listing part.

[31349] VGAM2242 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2242 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2242 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[31350] VGAM2242 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2242 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2242 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed

sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2242 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2242 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[31351] The complementary binding of VGAM2242 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2242 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2242 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2242 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target

protein is therefore outlined by a broken line.

[31352] It is appreciated that VGAM2242 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2242 host target genes. The mRNA of each one of this plurality of VGAM2242 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2242 RNA, herein designated VGAM RNA, and which when bound by VGAM2242 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2242 host target proteins.

[31353] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2242 gene, herein designated VGAM GENE, on one or more VGAM2242 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate ex-

pression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[31354] It is yet further appreciated that a function of VGAM2242 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2242 include diagnosis, prevention and treatment of viral infection by porcine epidemic diarrhea virus. Specific functions, and accordingly utilities, of VGAM2242 correlate with, and may be deduced from, the identity of the host target genes which VGAM2242 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[31355] Nucleotide sequences of the VGAM2242 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2242 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2242 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2242 are further described hereinbelow with reference to Table 1.

[31356] Nucleotide sequences of host target binding sites, such as

BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2242 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[31357] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2243 (VGAM2243) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[31358] VGAM2243 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2243 was detected is described hereinabove with reference to Figs. 2-8.

[31359] VGAM2243 gene, herein designated VGAM GENE, is a viral gene contained in the genome of porcine epidemic diarrhea virus. VGAM2243 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[31360] VGAM2243 gene, herein designated VGAM GENE, encodes a VGAM2243 precursor RNA, herein designated VGAM

PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2243 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2243 precursor RNA is designated SEQ ID:2229, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2229 is located at position 19645 relative to the genome of porcine epidemic diarrhea virus.

[31361] VGAM2243 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2243 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[31362] An enzyme complex designated DICER COMPLEX, dices the VGAM2243 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2243 RNA,

herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM2243 RNA is designated SEQ ID:4954, and is provided hereinbelow with reference to the sequence listing part.

[31363] VGAM2243 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2243 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2243 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[31364] VGAM2243 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2243 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nu-

cleotide sequence of VGAM2243 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2243 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2243 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[31365] The complementary binding of VGAM2243 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2243 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2243 host target RNA, herein designated VGAM HOST TARGET

RNA, into VGAM2243 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[31366] It is appreciated that VGAM2243 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2243 host target genes. The mRNA of each one of this plurality of VGAM2243 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2243 RNA, herein designated VGAM RNA, and which when bound by VGAM2243 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2243 host target proteins.

[31367] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2243 gene, herein designated VGAM GENE, on one or more VGAM2243 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4

and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[31368] It is yet further appreciated that a function of VGAM2243 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2243 include diagnosis, prevention and treatment of viral infection by porcine epidemic diarrhea virus. Specific functions, and accordingly utilities, of VGAM2243 correlate with, and may be deduced from, the identity of the host target genes which VGAM2243 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[31369] Nucleotide sequences of the VGAM2243 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2243 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2243 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2243 are further

described hereinbelow with reference to Table 1.

[31370] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2243 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[31371] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2244 (VGAM2244) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[31372] VGAM2244 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2244 was detected is described hereinabove with reference to Figs. 2-8.

[31373] VGAM2244 gene, herein designated VGAM GENE, is a viral gene contained in the genome of porcine epidemic diarrhea virus. VGAM2244 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[31374] VGAM2244 gene, herein designated VGAM GENE, encodes a VGAM2244 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2244 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2244 precursor RNA is designated SEQ ID:2230, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2230 is located at position 23117 relative to the genome of porcine epidemic diarrhea virus.

[31375] VGAM2244 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2244 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[31376] An enzyme complex designated DICER COMPLEX, dices

the VGAM2244 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2244 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM2244 RNA is designated SEQ ID:4955, and is provided hereinbelow with reference to the sequence listing part.

[31377] VGAM2244 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2244 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2244 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[31378] VGAM2244 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2244 host target

RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2244 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2244 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2244 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[31379] The complementary binding of VGAM2244 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2244 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE

II and BINDING SITE III, inhibits translation of VGAM2244 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2244 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[31380] It is appreciated that VGAM2244 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2244 host target genes. The mRNA of each one of this plurality of VGAM2244 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2244 RNA, herein designated VGAM RNA, and which when bound by VGAM2244 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2244 host target proteins.

[31381] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2244 gene, herein designated VGAM GENE, on one or more VGAM2244 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a spe-

cific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[31382] It is yet further appreciated that a function of VGAM2244 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2244 include diagnosis, prevention and treatment of viral infection by porcine epidemic diarrhea virus. Specific functions, and accordingly utilities, of VGAM2244 correlate with, and may be deduced from, the identity of the host target genes which VGAM2244 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[31383] Nucleotide sequences of the VGAM2244 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2244 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of

VGAM2244 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2244 are further described hereinbelow with reference to Table 1.

[31384] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2244 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[31385] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2245 (VGAM2245) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[31386] VGAM2245 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2245 was detected is described hereinabove with reference to Figs. 2-8.

[31387] VGAM2245 gene, herein designated VGAM GENE, is a viral gene contained in the genome of porcine epidemic diarrhea virus. VGAM2245 host target gene, herein desig-

nated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[31388] VGAM2245 gene, herein designated VGAM GENE, encodes a VGAM2245 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2245 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2245 precursor RNA is designated SEQ ID:2231, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2231 is located at position 11817 relative to the genome of porcine epidemic diarrhea virus.

[31389] VGAM2245 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2245 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of

the second half thereof.

[31390] An enzyme complex designated DICER COMPLEX, dices the VGAM2245 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2245 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM2245 RNA is designated SEQ ID:4956, and is provided hereinbelow with reference to the sequence listing part.

[31391] VGAM2245 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2245 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2245 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[31392] VGAM2245 RNA, herein designated VGAM RNA, binds

complementarily to one or more host target binding sites located in untranslated regions of VGAM2245 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2245 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2245 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2245 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[31393] The complementary binding of VGAM2245 RNA, herein designated VGAM RNA, to host target binding sites on

VGAM2245 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2245 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2245 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[31394] It is appreciated that VGAM2245 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2245 host target genes. The mRNA of each one of this plurality of VGAM2245 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2245 RNA, herein designated VGAM RNA, and which when bound by VGAM2245 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2245 host target proteins.

[31395] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2245 gene, herein designated VGAM GENE, on one or more VGAM2245 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other

known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[31396] It is yet further appreciated that a function of VGAM2245 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2245 include diagnosis, prevention and treatment of viral infection by porcine epidemic diarrhea virus. Specific functions, and accordingly utilities, of VGAM2245 correlate with, and may be deduced from, the identity of the host target genes which VGAM2245 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[31397] Nucleotide sequences of the VGAM2245 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the

diced VGAM2245 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2245 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2245 are further described hereinbelow with reference to Table 1.

[31398] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2245 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[31399] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2246 (VGAM2246) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[31400] VGAM2246 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2246 was detected is described hereinabove with reference to Figs. 2-8.

[31401] VGAM2246 gene, herein designated VGAM GENE, is a viral

gene contained in the genome of porcine epidemic diarrhea virus. VGAM2246 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[31402] VGAM2246 gene, herein designated VGAM GENE, encodes a VGAM2246 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2246 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2246 precursor RNA is designated SEQ ID:2232, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2232 is located at position 4217 relative to the genome of porcine epidemic diarrhea virus.

[31403] VGAM2246 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2246 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial

inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[31404] An enzyme complex designated DICER COMPLEX, dices the VGAM2246 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2246 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 71%) nucleotide sequence of VGAM2246 RNA is designated SEQ ID:4957, and is provided hereinbelow with reference to the sequence listing part.

[31405] VGAM2246 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2246 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2246 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[31406] VGAM2246 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2246 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2246 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2246 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2246 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[31407] The complementary binding of VGAM2246 RNA, herein

designated VGAM RNA, to host target binding sites on VGAM2246 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2246 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2246 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[31408] It is appreciated that VGAM2246 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2246 host target genes. The mRNA of each one of this plurality of VGAM2246 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2246 RNA, herein designated VGAM RNA, and which when bound by VGAM2246 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2246 host target proteins.

[31409] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2246 gene, herein designated VGAM GENE, on one or more VGAM2246 host target gene, herein designated

VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[31410] It is yet further appreciated that a function of VGAM2246 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2246 include diagnosis, prevention and treatment of viral infection by porcine epidemic diarrhea virus. Specific functions, and accordingly utilities, of VGAM2246 correlate with, and may be deduced from, the identity of the host target genes which VGAM2246 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[31411] Nucleotide sequences of the VGAM2246 precursor RNA,

herein designated VGAM PRECURSOR RNA, and of the diced VGAM2246 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2246 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2246 are further described hereinbelow with reference to Table 1.

[31412] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2246 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[31413] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2247 (VGAM2247) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[31414] VGAM2247 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2247 was detected is described hereinabove with reference to Figs. 2-8.

[31415] VGAM2247 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Transmissible gastroenteritis virus. VGAM2247 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[31416] VGAM2247 gene, herein designated VGAM GENE, encodes a VGAM2247 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2247 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2247 precursor RNA is designated SEQ ID:2233, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2233 is located at position 6648 relative to the genome of Transmissible gastroenteritis virus.

[31417] VGAM2247 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2247 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the

fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[31418] An enzyme complex designated DICER COMPLEX, dices the VGAM2247 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2247 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 71%) nucleotide sequence of VGAM2247 RNA is designated SEQ ID:4958, and is provided hereinbelow with reference to the sequence listing part.

[31419] VGAM2247 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2247 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2247 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and

a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[31420] VGAM2247 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2247 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2247 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2247 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2247 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both

3UTR and 5UTR regions.

[31421] The complementary binding of VGAM2247 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2247 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2247 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2247 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[31422] It is appreciated that VGAM2247 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2247 host target genes. The mRNA of each one of this plurality of VGAM2247 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2247 RNA, herein designated VGAM RNA, and which when bound by VGAM2247 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2247 host target proteins.

[31423] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by

VGAM2247 gene, herein designated VGAM GENE, on one or more VGAM2247 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[31424] It is yet further appreciated that a function of VGAM2247 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2247 include diagnosis, prevention and treatment of viral infection by Transmissible gastroenteritis virus. Specific functions, and accordingly utilities, of VGAM2247 correlate with, and may be deduced from, the identity of the host target genes which VGAM2247 binds and inhibits, and the function of these host target genes,

as elaborated hereinbelow.

[31425] Nucleotide sequences of the VGAM2247 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2247 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2247 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2247 are further described hereinbelow with reference to Table 1.

[31426] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2247 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[31427] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2248 (VGAM2248) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[31428] VGAM2248 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene.

The method by which VGAM2248 was detected is described hereinabove with reference to Figs. 2-8.

[31429] VGAM2248 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Transmissible gastroenteritis virus. VGAM2248 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[31430] VGAM2248 gene, herein designated VGAM GENE, encodes a VGAM2248 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2248 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2248 precursor RNA is designated SEQ ID:2234, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2234 is located at position 10637 relative to the genome of Transmissible gastroenteritis virus.

[31431] VGAM2248 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2248 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure.

As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[31432] An enzyme complex designated DICER COMPLEX, dices the VGAM2248 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2248 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 46%) nucleotide sequence of VGAM2248 RNA is designated SEQ ID:4959, and is provided hereinbelow with reference to the sequence listing part.

[31433] VGAM2248 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2248 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2248 host target RNA, herein designated VGAM HOST TARGET RNA, comprises

three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[31434] VGAM2248 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2248 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2248 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2248 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2248 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an

example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[31435] The complementary binding of VGAM2248 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2248 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2248 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2248 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[31436] It is appreciated that VGAM2248 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2248 host target genes. The mRNA of each one of this plurality of VGAM2248 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2248 RNA, herein designated VGAM RNA, and which when bound by VGAM2248 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2248 host target proteins.

[31437] It is further appreciated by one skilled in the art that the

mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2248 gene, herein designated VGAM GENE, on one or more VGAM2248 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[31438] It is yet further appreciated that a function of VGAM2248 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2248 include diagnosis, prevention and treatment of viral infection by Transmissible gastroenteritis virus. Specific functions, and accordingly utilities, of VGAM2248 correlate with, and may be deduced from, the

identity of the host target genes which VGAM2248 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[31439] Nucleotide sequences of the VGAM2248 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2248 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2248 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2248 are further described hereinbelow with reference to Table 1.

[31440] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2248 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[31441] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2249 (VGAM2249) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[31442] VGAM2249 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2249 was detected is described hereinabove with reference to Figs. 2-8.

[31443] VGAM2249 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Transmissible gastroenteritis virus. VGAM2249 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[31444] VGAM2249 gene, herein designated VGAM GENE, encodes a VGAM2249 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2249 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2249 precursor RNA is designated SEQ ID:2235, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2235 is located at position 7046 relative to the genome of Transmissible gastroenteritis virus.

[31445] VGAM2249 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2249 folded

precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[31446] An enzyme complex designated DICER COMPLEX, dices the VGAM2249 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2249 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM2249 RNA is designated SEQ ID:4960, and is provided hereinbelow with reference to the sequence listing part.

[31447] VGAM2249 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2249 host target RNA, herein designated

VGAM HOST TARGET RNA. VGAM2249 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[31448] VGAM2249 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2249 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2249 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2249 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2249 host target RNA, herein designated VGAM HOST TARGET RNA.

It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[31449] The complementary binding of VGAM2249 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2249 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2249 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2249 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[31450] It is appreciated that VGAM2249 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2249 host target genes. The mRNA of each one of this plurality of VGAM2249 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2249 RNA, herein designated VGAM RNA, and which when bound by VGAM2249 RNA, herein designated VGAM RNA, causes inhibition of translation of

respective one or more VGAM2249 host target proteins.

[31451] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2249 gene, herein designated VGAM GENE, on one or more VGAM2249 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[31452] It is yet further appreciated that a function of VGAM2249 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2249 include diagnosis, prevention and treatment of viral infection by Transmissible gastroenteri-

tis virus. Specific functions, and accordingly utilities, of VGAM2249 correlate with, and may be deduced from, the identity of the host target genes which VGAM2249 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[31453] Nucleotide sequences of the VGAM2249 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2249 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2249 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2249 are further described hereinbelow with reference to Table 1.

[31454] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2249 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[31455] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2250 (VGAM2250) viral gene, which modulates expression of respective host target genes thereof, the func-

tion and utility of which host target genes is known in the art.

[31456] VGAM2250 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2250 was detected is described hereinabove with reference to Figs. 2-8.

[31457] VGAM2250 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Transmissible gastroenteritis virus. VGAM2250 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[31458] VGAM2250 gene, herein designated VGAM GENE, encodes a VGAM2250 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2250 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2250 precursor RNA is designated SEQ ID:2236, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2236 is located at position 14152 relative to the genome of Transmissible gastroenteritis virus.

[31459] VGAM2250 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2250 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[31460] An enzyme complex designated DICER COMPLEX, dices the VGAM2250 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2250 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM2250 RNA is designated SEQ ID:4961, and is provided hereinbelow with reference to the sequence listing part.

[31461] VGAM2250 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2250 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2250 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[31462] VGAM2250 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2250 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2250 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2250 RNA, herein designated VGAM RNA, may have a different number of host target

binding sites in untranslated regions of a VGAM2250 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[31463] The complementary binding of VGAM2250 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2250 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2250 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2250 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[31464] It is appreciated that VGAM2250 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2250 host target genes. The mRNA of each one of this plurality of VGAM2250 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2250 RNA, herein designated VGAM

RNA, and which when bound by VGAM2250 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2250 host target proteins.

[31465] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2250 gene, herein designated VGAM GENE, on one or more VGAM2250 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[31466] It is yet further appreciated that a function of VGAM2250 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly,

utilities of VGAM2250 include diagnosis, prevention and treatment of viral infection by Transmissible gastroenteritis virus. Specific functions, and accordingly utilities, of VGAM2250 correlate with, and may be deduced from, the identity of the host target genes which VGAM2250 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[31467] Nucleotide sequences of the VGAM2250 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2250 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2250 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2250 are further described hereinbelow with reference to Table 1.

[31468] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2250 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[31469] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Mes-

senger 2251 (VGAM2251) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[31470] VGAM2251 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2251 was detected is described hereinabove with reference to Figs. 2-8.

[31471] VGAM2251 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Transmissible gastroenteritis virus. VGAM2251 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[31472] VGAM2251 gene, herein designated VGAM GENE, encodes a VGAM2251 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2251 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2251 precursor RNA is designated SEQ ID:2237, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2237 is located at position 4728

relative to the genome of Transmissible gastroenteritis virus.

[31473] VGAM2251 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2251 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[31474] An enzyme complex designated DICER COMPLEX, dices the VGAM2251 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2251 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide sequence of VGAM2251 RNA is designated SEQ ID:4962, and is provided hereinbelow with reference to the sequence

listing part.

[31475] VGAM2251 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2251 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2251 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[31476] VGAM2251 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2251 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2251 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not

meant to be limiting VGAM2251 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2251 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[31477] The complementary binding of VGAM2251 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2251 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2251 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2251 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[31478] It is appreciated that VGAM2251 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2251 host target genes. The mRNA of each one of this plurality of VGAM2251 host target genes comprises one or more host target binding sites, each

having a nucleotide sequence which is at least partly complementary to VGAM2251 RNA, herein designated VGAM RNA, and which when bound by VGAM2251 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2251 host target proteins.

[31479] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2251 gene, herein designated VGAM GENE, on one or more VGAM2251 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[31480] It is yet further appreciated that a function of VGAM2251

is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2251 include diagnosis, prevention and treatment of viral infection by Transmissible gastroenteritis virus. Specific functions, and accordingly utilities, of VGAM2251 correlate with, and may be deduced from, the identity of the host target genes which VGAM2251 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[31481] Nucleotide sequences of the VGAM2251 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2251 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2251 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2251 are further described hereinbelow with reference to Table 1.

[31482] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2251 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[31483] Fig. 1 further provides a conceptual description of another

novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2252 (VGAM2252) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[31484] VGAM2252 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2252 was detected is described hereinabove with reference to Figs. 2-8.

[31485] VGAM2252 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Transmissible gastroenteritis virus. VGAM2252 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[31486] VGAM2252 gene, herein designated VGAM GENE, encodes a VGAM2252 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2252 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2252 precursor RNA is designated SEQ ID:2238, and is provided here-

inbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2238 is located at position 9049 relative to the genome of Transmissible gastroenteritis virus.

[31487] VGAM2252 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2252 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[31488] An enzyme complex designated DICER COMPLEX, dices the VGAM2252 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2252 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 87%) nucleotide se-

quence of VGAM2252 RNA is designated SEQ ID:4963, and is provided hereinbelow with reference to the sequence listing part.

[31489] VGAM2252 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2252 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2252 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[31490] VGAM2252 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2252 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2252 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is ap-

preciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2252 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2252 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[31491] The complementary binding of VGAM2252 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2252 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2252 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2252 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[31492] It is appreciated that VGAM2252 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2252 host target genes. The mRNA of

each one of this plurality of VGAM2252 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2252 RNA, herein designated VGAM RNA, and which when bound by VGAM2252 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2252 host target proteins.

[31493] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2252 gene, herein designated VGAM GENE, on one or more VGAM2252 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science

294,779 (2001)).

[31494] It is yet further appreciated that a function of VGAM2252 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2252 include diagnosis, prevention and treatment of viral infection by Transmissible gastroenteritis virus. Specific functions, and accordingly utilities, of VGAM2252 correlate with, and may be deduced from, the identity of the host target genes which VGAM2252 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[31495] Nucleotide sequences of the VGAM2252 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2252 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2252 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2252 are further described hereinbelow with reference to Table 1.

[31496] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2252 RNA, herein designated VGAM RNA, are de-

scribed hereinbelow with reference to Table 2.

[31497] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2253 (VGAM2253) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[31498] VGAM2253 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2253 was detected is described hereinabove with reference to Figs. 2-8.

[31499] VGAM2253 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Transmissible gastroenteritis virus. VGAM2253 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[31500] VGAM2253 gene, herein designated VGAM GENE, encodes a VGAM2253 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2253 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly

similar to the nucleotide sequence of VGAM2253 precursor RNA is designated SEQ ID:2239, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2239 is located at position 2988 relative to the genome of Transmissible gastroenteritis virus.

[31501] VGAM2253 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2253 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[31502] An enzyme complex designated DICER COMPLEX, dices the VGAM2253 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2253 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer together with other necessary proteins. A probable (over 64%) nucleotide sequence of VGAM2253 RNA is designated SEQ ID:4964, and is provided hereinbelow with reference to the sequence listing part.

[31503] VGAM2253 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2253 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2253 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[31504] VGAM2253 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2253 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2253 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3

such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2253 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2253 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[31505] The complementary binding of VGAM2253 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2253 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2253 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2253 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[31506] It is appreciated that VGAM2253 host target gene, herein

designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2253 host target genes. The mRNA of each one of this plurality of VGAM2253 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2253 RNA, herein designated VGAM RNA, and which when bound by VGAM2253 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2253 host target proteins.

[31507] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2253 gene, herein designated VGAM GENE, on one or more VGAM2253 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these

other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[31508] It is yet further appreciated that a function of VGAM2253 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2253 include diagnosis, prevention and treatment of viral infection by Transmissible gastroenteritis virus. Specific functions, and accordingly utilities, of VGAM2253 correlate with, and may be deduced from, the identity of the host target genes which VGAM2253 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[31509] Nucleotide sequences of the VGAM2253 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2253 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2253 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2253 are further described hereinbelow with reference to Table 1.

[31510] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the

complementarity of each of these host target binding sites to VGAM2253 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[31511] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2254 (VGAM2254) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[31512] VGAM2254 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2254 was detected is described hereinabove with reference to Figs. 2-8.

[31513] VGAM2254 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Transmissible gastroenteritis virus. VGAM2254 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[31514] VGAM2254 gene, herein designated VGAM GENE, encodes a VGAM2254 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2254 precursor RNA,

herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2254 precursor RNA is designated SEQ ID:2240, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2240 is located at position 9818 relative to the genome of Transmissible gastroenteritis virus.

[31515] VGAM2254 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2254 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[31516] An enzyme complex designated DICER COMPLEX, dices the VGAM2254 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2254 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a

hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide sequence of VGAM2254 RNA is designated SEQ ID:4965, and is provided hereinbelow with reference to the sequence listing part.

[31517] VGAM2254 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2254 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2254 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[31518] VGAM2254 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2254 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2254 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed

sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2254 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2254 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[31519] The complementary binding of VGAM2254 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2254 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2254 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2254 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target

protein is therefore outlined by a broken line.

[31520] It is appreciated that VGAM2254 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2254 host target genes. The mRNA of each one of this plurality of VGAM2254 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2254 RNA, herein designated VGAM RNA, and which when bound by VGAM2254 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2254 host target proteins.

[31521] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2254 gene, herein designated VGAM GENE, on one or more VGAM2254 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate ex-

pression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[31522] It is yet further appreciated that a function of VGAM2254 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2254 include diagnosis, prevention and treatment of viral infection by Transmissible gastroenteritis virus. Specific functions, and accordingly utilities, of VGAM2254 correlate with, and may be deduced from, the identity of the host target genes which VGAM2254 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[31523] Nucleotide sequences of the VGAM2254 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2254 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2254 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2254 are further described hereinbelow with reference to Table 1.

[31524] Nucleotide sequences of host target binding sites, such as

BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2254 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[31525] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2255 (VGAM2255) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[31526] VGAM2255 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2255 was detected is described hereinabove with reference to Figs. 2-8.

[31527] VGAM2255 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Transmissible gastroenteritis virus. VGAM2255 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[31528] VGAM2255 gene, herein designated VGAM GENE, encodes a VGAM2255 precursor RNA, herein designated VGAM

PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2255 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2255 precursor RNA is designated SEQ ID:2241, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2241 is located at position 11215 relative to the genome of Transmissible gastroenteritis virus.

[31529] VGAM2255 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2255 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[31530] An enzyme complex designated DICER COMPLEX, dices the VGAM2255 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2255 RNA,

herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 47%) nucleotide sequence of VGAM2255 RNA is designated SEQ ID:4966, and is provided hereinbelow with reference to the sequence listing part.

[31531] VGAM2255 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2255 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2255 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[31532] VGAM2255 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2255 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nu-

cleotide sequence of VGAM2255 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2255 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2255 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[31533] The complementary binding of VGAM2255 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2255 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2255 host target RNA, herein designated VGAM HOST TARGET

RNA, into VGAM2255 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[31534] It is appreciated that VGAM2255 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2255 host target genes. The mRNA of each one of this plurality of VGAM2255 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2255 RNA, herein designated VGAM RNA, and which when bound by VGAM2255 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2255 host target proteins.

[31535] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2255 gene, herein designated VGAM GENE, on one or more VGAM2255 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4

and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[31536] It is yet further appreciated that a function of VGAM2255 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2255 include diagnosis, prevention and treatment of viral infection by Transmissible gastroenteritis virus. Specific functions, and accordingly utilities, of VGAM2255 correlate with, and may be deduced from, the identity of the host target genes which VGAM2255 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[31537] Nucleotide sequences of the VGAM2255 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2255 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2255 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2255 are further

described hereinbelow with reference to Table 1.

[31538] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2255 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[31539] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2256 (VGAM2256) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[31540] VGAM2256 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2256 was detected is described hereinabove with reference to Figs. 2-8.

[31541] VGAM2256 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Oat chlorotic stunt virus. VGAM2256 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[31542] VGAM2256 gene, herein designated VGAM GENE, encodes a VGAM2256 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2256 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2256 precursor RNA is designated SEQ ID:2242, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2242 is located at position 1813 relative to the genome of Oat chlorotic stunt virus.

[31543] VGAM2256 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2256 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[31544] An enzyme complex designated DICER COMPLEX, dices the VGAM2256 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, into VGAM2256 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 44%) nucleotide sequence of VGAM2256 RNA is designated SEQ ID:4967, and is provided hereinbelow with reference to the sequence listing part.

[31545] VGAM2256 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2256 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2256 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[31546] VGAM2256 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2256 host target RNA, herein designated VGAM HOST TARGET RNA. This

complementary binding is due to the fact that the nucleotide sequence of VGAM2256 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2256 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2256 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[31547] The complementary binding of VGAM2256 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2256 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2256

host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2256 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[31548] It is appreciated that VGAM2256 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2256 host target genes. The mRNA of each one of this plurality of VGAM2256 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2256 RNA, herein designated VGAM RNA, and which when bound by VGAM2256 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2256 host target proteins.

[31549] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2256 gene, herein designated VGAM GENE, on one or more VGAM2256 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated

only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[31550] It is yet further appreciated that a function of VGAM2256 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2256 include diagnosis, prevention and treatment of viral infection by Oat chlorotic stunt virus. Specific functions, and accordingly utilities, of VGAM2256 correlate with, and may be deduced from, the identity of the host target genes which VGAM2256 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[31551] Nucleotide sequences of the VGAM2256 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2256 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2256 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, of VGAM2256 are further described hereinbelow with reference to Table 1.

[31552] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2256 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[31553] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2257 (VGAM2257) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[31554] VGAM2257 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2257 was detected is described hereinabove with reference to Figs. 2-8.

[31555] VGAM2257 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Oat chlorotic stunt virus. VGAM2257 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the

human genome.

[31556] VGAM2257 gene, herein designated VGAM GENE, encodes a VGAM2257 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2257 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2257 precursor RNA is designated SEQ ID:2243, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2243 is located at position 987 relative to the genome of Oat chlorotic stunt virus.

[31557] VGAM2257 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2257 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[31558] An enzyme complex designated DICER COMPLEX, dices

the VGAM2257 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2257 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 71%) nucleotide sequence of VGAM2257 RNA is designated SEQ ID:4968, and is provided hereinbelow with reference to the sequence listing part.

[31559] VGAM2257 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2257 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2257 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[31560] VGAM2257 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2257 host target

RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2257 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2257 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2257 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[31561] The complementary binding of VGAM2257 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2257 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE

II and BINDING SITE III, inhibits translation of VGAM2257 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2257 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[31562] It is appreciated that VGAM2257 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2257 host target genes. The mRNA of each one of this plurality of VGAM2257 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2257 RNA, herein designated VGAM RNA, and which when bound by VGAM2257 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2257 host target proteins.

[31563] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2257 gene, herein designated VGAM GENE, on one or more VGAM2257 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a spe-

cific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[31564] It is yet further appreciated that a function of VGAM2257 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2257 include diagnosis, prevention and treatment of viral infection by Oat chlorotic stunt virus. Specific functions, and accordingly utilities, of VGAM2257 correlate with, and may be deduced from, the identity of the host target genes which VGAM2257 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[31565] Nucleotide sequences of the VGAM2257 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2257 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of

VGAM2257 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2257 are further described hereinbelow with reference to Table 1.

[31566] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2257 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[31567] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2258 (VGAM2258) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[31568] VGAM2258 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2258 was detected is described hereinabove with reference to Figs. 2-8.

[31569] VGAM2258 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Oat chlorotic stunt virus. VGAM2258 host target gene, herein designated VGAM

HOST TARGET GENE, is a human gene contained in the human genome.

[31570] VGAM2258 gene, herein designated VGAM GENE, encodes a VGAM2258 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2258 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2258 precursor RNA is designated SEQ ID:2244, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2244 is located at position 1727 relative to the genome of Oat chlorotic stunt virus.

[31571] VGAM2258 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2258 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[31572] An enzyme complex designated DICER COMPLEX, dices the VGAM2258 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2258 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 49%) nucleotide sequence of VGAM2258 RNA is designated SEQ ID:4969, and is provided hereinbelow with reference to the sequence listing part.

[31573] VGAM2258 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2258 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2258 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[31574] VGAM2258 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites

located in untranslated regions of VGAM2258 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2258 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2258 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2258 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[31575] The complementary binding of VGAM2258 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2258 host target RNA, herein designated VGAM

HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2258 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2258 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[31576] It is appreciated that VGAM2258 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2258 host target genes. The mRNA of each one of this plurality of VGAM2258 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2258 RNA, herein designated VGAM RNA, and which when bound by VGAM2258 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2258 host target proteins.

[31577] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2258 gene, herein designated VGAM GENE, on one or more VGAM2258 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove

with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[31578] It is yet further appreciated that a function of VGAM2258 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2258 include diagnosis, prevention and treatment of viral infection by Oat chlorotic stunt virus. Specific functions, and accordingly utilities, of VGAM2258 correlate with, and may be deduced from, the identity of the host target genes which VGAM2258 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[31579] Nucleotide sequences of the VGAM2258 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2258 RNA, herein designated VGAM RNA, and

a schematic representation of the secondary folding of VGAM2258 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2258 are further described hereinbelow with reference to Table 1.

[31580] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2258 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[31581] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2259 (VGAM2259) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[31582] VGAM2259 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2259 was detected is described hereinabove with reference to Figs. 2-8.

[31583] VGAM2259 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Alcelaphine herpesvirus

1. VGAM2259 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[31584] VGAM2259 gene, herein designated VGAM GENE, encodes a VGAM2259 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2259 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2259 precursor RNA is designated SEQ ID:2245, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2245 is located at position 30401 relative to the genome of Alcelaphine herpesvirus 1.

[31585] VGAM2259 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2259 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial

inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[31586] An enzyme complex designated DICER COMPLEX, dices the VGAM2259 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2259 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 72%) nucleotide sequence of VGAM2259 RNA is designated SEQ ID:4970, and is provided hereinbelow with reference to the sequence listing part.

[31587] VGAM2259 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2259 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2259 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[31588] VGAM2259 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2259 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2259 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2259 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2259 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[31589] The complementary binding of VGAM2259 RNA, herein

designated VGAM RNA, to host target binding sites on VGAM2259 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2259 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2259 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[31590] It is appreciated that VGAM2259 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2259 host target genes. The mRNA of each one of this plurality of VGAM2259 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2259 RNA, herein designated VGAM RNA, and which when bound by VGAM2259 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2259 host target proteins.

[31591] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2259 gene, herein designated VGAM GENE, on one or more VGAM2259 host target gene, herein designated

VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[31592] It is yet further appreciated that a function of VGAM2259 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2259 include diagnosis, prevention and treatment of viral infection by Alcelaphine herpesvirus 1. Specific functions, and accordingly utilities, of VGAM2259 correlate with, and may be deduced from, the identity of the host target genes which VGAM2259 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[31593] Nucleotide sequences of the VGAM2259 precursor RNA,

herein designated VGAM PRECURSOR RNA, and of the diced VGAM2259 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2259 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2259 are further described hereinbelow with reference to Table 1.

[31594] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2259 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[31595] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2260 (VGAM2260) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[31596] VGAM2260 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2260 was detected is described hereinabove with reference to Figs. 2-8.

[31597] VGAM2260 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Alcelaphine herpesvirus 1. VGAM2260 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[31598] VGAM2260 gene, herein designated VGAM GENE, encodes a VGAM2260 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2260 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2260 precursor RNA is designated SEQ ID:2246, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2246 is located at position 26713 relative to the genome of Alcelaphine herpesvirus 1.

[31599] VGAM2260 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2260 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the

fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[31600] An enzyme complex designated DICER COMPLEX, dices the VGAM2260 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2260 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 62%) nucleotide sequence of VGAM2260 RNA is designated SEQ ID:4971, and is provided hereinbelow with reference to the sequence listing part.

[31601] VGAM2260 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2260 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2260 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and

a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[31602] VGAM2260 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2260 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2260 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2260 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2260 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both

3UTR and 5UTR regions.

[31603] The complementary binding of VGAM2260 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2260 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2260 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2260 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[31604] It is appreciated that VGAM2260 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2260 host target genes. The mRNA of each one of this plurality of VGAM2260 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2260 RNA, herein designated VGAM RNA, and which when bound by VGAM2260 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2260 host target proteins.

[31605] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by

VGAM2260 gene, herein designated VGAM GENE, on one or more VGAM2260 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[31606] It is yet further appreciated that a function of VGAM2260 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2260 include diagnosis, prevention and treatment of viral infection by Alcelaphine herpesvirus 1. Specific functions, and accordingly utilities, of VGAM2260 correlate with, and may be deduced from, the identity of the host target genes which VGAM2260 binds and inhibits, and the function of these host target genes, as

elaborated hereinbelow.

[31607] Nucleotide sequences of the VGAM2260 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2260 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2260 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2260 are further described hereinbelow with reference to Table 1.

[31608] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2260 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[31609] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2261 (VGAM2261) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[31610] VGAM2261 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2261 was detected is described hereinabove with reference to Figs. 2-8.

[31611] VGAM2261 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Alcelaphine herpesvirus 1. VGAM2261 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[31612] VGAM2261 gene, herein designated VGAM GENE, encodes

a VGAM2261 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2261 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2261 precursor RNA is designated SEQ ID:2247, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2247 is located at position 24763 relative to the genome of Alcelaphine herpesvirus 1.

[31613] VGAM2261 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2261 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[31614] An enzyme complex designated DICER COMPLEX, dices the VGAM2261 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, into VGAM2261 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide sequence of VGAM2261 RNA is designated SEQ ID:4972, and is provided hereinbelow with reference to the sequence listing part.

[31615] VGAM2261 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2261 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2261 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[31616] VGAM2261 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2261 host target RNA, herein designated VGAM HOST TARGET RNA. This

complementary binding is due to the fact that the nucleotide sequence of VGAM2261 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2261 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2261 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[31617] The complementary binding of VGAM2261 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2261 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2261

host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2261 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[31618] It is appreciated that VGAM2261 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2261 host target genes. The mRNA of each one of this plurality of VGAM2261 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2261 RNA, herein designated VGAM RNA, and which when bound by VGAM2261 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2261 host target proteins.

[31619] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2261 gene, herein designated VGAM GENE, on one or more VGAM2261 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated

only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[31620] It is yet further appreciated that a function of VGAM2261 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2261 include diagnosis, prevention and treatment of viral infection by Alcelaphine herpesvirus 1. Specific functions, and accordingly utilities, of VGAM2261 correlate with, and may be deduced from, the identity of the host target genes which VGAM2261 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[31621] Nucleotide sequences of the VGAM2261 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2261 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2261 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, of VGAM2261 are further described hereinbelow with reference to Table 1.

[31622] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2261 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[31623] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2262 (VGAM2262) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[31624] VGAM2262 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2262 was detected is described hereinabove with reference to Figs. 2-8.

[31625] VGAM2262 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Alcelaphine herpesvirus 1. VGAM2262 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the

human genome.

[31626] VGAM2262 gene, herein designated VGAM GENE, encodes a VGAM2262 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2262 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2262 precursor RNA is designated SEQ ID:2248, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2248 is located at position 17900 relative to the genome of Alcelaphine herpesvirus 1.

[31627] VGAM2262 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2262 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[31628] An enzyme complex designated DICER COMPLEX, dices the VGAM2262 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2262 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 59%) nucleotide sequence of VGAM2262 RNA is designated SEQ ID:4973, and is provided hereinbelow with reference to the sequence listing part.

[31629] VGAM2262 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2262 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2262 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[31630] VGAM2262 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites

located in untranslated regions of VGAM2262 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2262 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2262 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2262 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[31631] The complementary binding of VGAM2262 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2262 host target RNA, herein designated VGAM

HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2262 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2262 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[31632] It is appreciated that VGAM2262 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2262 host target genes. The mRNA of each one of this plurality of VGAM2262 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2262 RNA, herein designated VGAM RNA, and which when bound by VGAM2262 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2262 host target proteins.

[31633] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2262 gene, herein designated VGAM GENE, on one or more VGAM2262 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove

with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[31634] It is yet further appreciated that a function of VGAM2262 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2262 include diagnosis, prevention and treatment of viral infection by Alcelaphine herpesvirus 1. Specific functions, and accordingly utilities, of VGAM2262 correlate with, and may be deduced from, the identity of the host target genes which VGAM2262 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[31635] Nucleotide sequences of the VGAM2262 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2262 RNA, herein designated VGAM RNA, and

a schematic representation of the secondary folding of VGAM2262 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2262 are further described hereinbelow with reference to Table 1.

[31636] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2262 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[31637] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2263 (VGAM2263) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[31638] VGAM2263 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2263 was detected is described hereinabove with reference to Figs. 2-8.

[31639] VGAM2263 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Alcelaphine herpesvirus

1. VGAM2263 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[31640] VGAM2263 gene, herein designated VGAM GENE, encodes a VGAM2263 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2263 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2263 precursor RNA is designated SEQ ID:2249, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2249 is located at position 27186 relative to the genome of Alcelaphine herpesvirus 1.

[31641] VGAM2263 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2263 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial

inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[31642] An enzyme complex designated DICER COMPLEX, dices the VGAM2263 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2263 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 71%) nucleotide sequence of VGAM2263 RNA is designated SEQ ID:4974, and is provided hereinbelow with reference to the sequence listing part.

[31643] VGAM2263 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2263 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2263 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[31644] VGAM2263 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2263 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2263 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2263 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2263 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[31645] The complementary binding of VGAM2263 RNA, herein

designated VGAM RNA, to host target binding sites on VGAM2263 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2263 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2263 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[31646] It is appreciated that VGAM2263 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2263 host target genes. The mRNA of each one of this plurality of VGAM2263 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2263 RNA, herein designated VGAM RNA, and which when bound by VGAM2263 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2263 host target proteins.

[31647] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2263 gene, herein designated VGAM GENE, on one or more VGAM2263 host target gene, herein designated

VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[31648] It is yet further appreciated that a function of VGAM2263 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2263 include diagnosis, prevention and treatment of viral infection by Alcelaphine herpesvirus 1. Specific functions, and accordingly utilities, of VGAM2263 correlate with, and may be deduced from, the identity of the host target genes which VGAM2263 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[31649] Nucleotide sequences of the VGAM2263 precursor RNA,

herein designated VGAM PRECURSOR RNA, and of the diced VGAM2263 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2263 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2263 are further described hereinbelow with reference to Table 1.

[31650] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2263 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[31651] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2264 (VGAM2264) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[31652] VGAM2264 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2264 was detected is described hereinabove with reference to Figs. 2-8.

[31653] VGAM2264 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Alcelaphine herpesvirus 1. VGAM2264 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[31654] VGAM2264 gene, herein designated VGAM GENE, encodes a VGAM2264 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2264 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2264 precursor RNA is designated SEQ ID:2250, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2250 is located at position 20319 relative to the genome of Alcelaphine herpesvirus 1.

[31655] VGAM2264 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2264 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the

fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[31656] An enzyme complex designated DICER COMPLEX, dices the VGAM2264 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2264 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM2264 RNA is designated SEQ ID:4975, and is provided hereinbelow with reference to the sequence listing part.

[31657] VGAM2264 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2264 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2264 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and

a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[31658] VGAM2264 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2264 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2264 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2264 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2264 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both

3UTR and 5UTR regions.

[31659] The complementary binding of VGAM2264 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2264 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2264 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2264 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[31660] It is appreciated that VGAM2264 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2264 host target genes. The mRNA of each one of this plurality of VGAM2264 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2264 RNA, herein designated VGAM RNA, and which when bound by VGAM2264 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2264 host target proteins.

[31661] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by

VGAM2264 gene, herein designated VGAM GENE, on one or more VGAM2264 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[31662] It is yet further appreciated that a function of VGAM2264 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2264 include diagnosis, prevention and treatment of viral infection by Alcelaphine herpesvirus 1. Specific functions, and accordingly utilities, of VGAM2264 correlate with, and may be deduced from, the identity of the host target genes which VGAM2264 binds and inhibits, and the function of these host target genes, as

elaborated hereinbelow.

[31663] Nucleotide sequences of the VGAM2264 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2264 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2264 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2264 are further described hereinbelow with reference to Table 1.

[31664] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2264 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[31665] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2265 (VGAM2265) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[31666] VGAM2265 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene.

The method by which VGAM2265 was detected is described hereinabove with reference to Figs. 2-8.

[31667] VGAM2265 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Alcelaphine herpesvirus 1. VGAM2265 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[31668] VGAM2265 gene, herein designated VGAM GENE, encodes a VGAM2265 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2265 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2265 precursor RNA is designated SEQ ID:2251, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2251 is located at position 27645 relative to the genome of Alcelaphine herpesvirus 1.

[31669] VGAM2265 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2265 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure.

As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[31670] An enzyme complex designated DICER COMPLEX, dices the VGAM2265 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2265 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide sequence of VGAM2265 RNA is designated SEQ ID:4976, and is provided hereinbelow with reference to the sequence listing part.

[31671] VGAM2265 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2265 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2265 host target RNA, herein designated VGAM HOST TARGET RNA, comprises

three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[31672] VGAM2265 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2265 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2265 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2265 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2265 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an

example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[31673] The complementary binding of VGAM2265 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2265 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2265 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2265 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[31674] It is appreciated that VGAM2265 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2265 host target genes. The mRNA of each one of this plurality of VGAM2265 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2265 RNA, herein designated VGAM RNA, and which when bound by VGAM2265 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2265 host target proteins.

[31675] It is further appreciated by one skilled in the art that the

mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2265 gene, herein designated VGAM GENE, on one or more VGAM2265 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[31676] It is yet further appreciated that a function of VGAM2265 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2265 include diagnosis, prevention and treatment of viral infection by Alcelaphine herpesvirus 1. Specific functions, and accordingly utilities, of VGAM2265 correlate with, and may be deduced from, the identity of

the host target genes which VGAM2265 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[31677] Nucleotide sequences of the VGAM2265 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2265 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2265 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2265 are further described hereinbelow with reference to Table 1.

[31678] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2265 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[31679] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2266 (VGAM2266) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[31680] VGAM2266 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2266 was detected is described hereinabove with reference to Figs. 2-8.

[31681] VGAM2266 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Alcelaphine herpesvirus 1. VGAM2266 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[31682] VGAM2266 gene, herein designated VGAM GENE, encodes a VGAM2266 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2266 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2266 precursor RNA is designated SEQ ID:2252, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2252 is located at position 27936 relative to the genome of Alcelaphine herpesvirus 1.

[31683] VGAM2266 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2266 folded

precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[31684] An enzyme complex designated DICER COMPLEX, dices the VGAM2266 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2266 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide sequence of VGAM2266 RNA is designated SEQ ID:4977, and is provided hereinbelow with reference to the sequence listing part.

[31685] VGAM2266 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2266 host target RNA, herein designated

VGAM HOST TARGET RNA. VGAM2266 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[31686] VGAM2266 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2266 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2266 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2266 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2266 host target RNA, herein designated VGAM HOST TARGET RNA.

It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[31687] The complementary binding of VGAM2266 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2266 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2266 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2266 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[31688] It is appreciated that VGAM2266 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2266 host target genes. The mRNA of each one of this plurality of VGAM2266 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2266 RNA, herein designated VGAM RNA, and which when bound by VGAM2266 RNA, herein designated VGAM RNA, causes inhibition of translation of

respective one or more VGAM2266 host target proteins.

[31689] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2266 gene, herein designated VGAM GENE, on one or more VGAM2266 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[31690] It is yet further appreciated that a function of VGAM2266 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2266 include diagnosis, prevention and treatment of viral infection by Alcelaphine herpesvirus 1.

Specific functions, and accordingly utilities, of VGAM2266 correlate with, and may be deduced from, the identity of the host target genes which VGAM2266 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[31691] Nucleotide sequences of the VGAM2266 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2266 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2266 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2266 are further described hereinbelow with reference to Table 1.

[31692] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2266 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[31693] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2267 (VGAM2267) viral gene, which modulates expression of respective host target genes thereof, the func-

tion and utility of which host target genes is known in the art.

[31694] VGAM2267 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2267 was detected is described hereinabove with reference to Figs. 2-8.

[31695] VGAM2267 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Alcelaphine herpesvirus 1. VGAM2267 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[31696] VGAM2267 gene, herein designated VGAM GENE, encodes a VGAM2267 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2267 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2267 precursor RNA is designated SEQ ID:2253, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2253 is located at position 29434 relative to the genome of Alcelaphine herpesvirus 1.

[31697] VGAM2267 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2267 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[31698] An enzyme complex designated DICER COMPLEX, dices the VGAM2267 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2267 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of VGAM2267 RNA is designated SEQ ID:4978, and is provided hereinbelow with reference to the sequence listing part.

[31699] VGAM2267 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2267 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2267 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[31700] VGAM2267 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2267 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2267 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2267 RNA, herein designated VGAM RNA, may have a different number of host target

binding sites in untranslated regions of a VGAM2267 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[31701] The complementary binding of VGAM2267 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2267 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2267 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2267 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[31702] It is appreciated that VGAM2267 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2267 host target genes. The mRNA of each one of this plurality of VGAM2267 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2267 RNA, herein designated VGAM

RNA, and which when bound by VGAM2267 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2267 host target proteins.

[31703] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2267 gene, herein designated VGAM GENE, on one or more VGAM2267 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[31704] It is yet further appreciated that a function of VGAM2267 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly,

utilities of VGAM2267 include diagnosis, prevention and treatment of viral infection by Alcelaphine herpesvirus 1. Specific functions, and accordingly utilities, of VGAM2267 correlate with, and may be deduced from, the identity of the host target genes which VGAM2267 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[31705] Nucleotide sequences of the VGAM2267 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2267 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2267 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2267 are further described hereinbelow with reference to Table 1.

[31706] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2267 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[31707] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Mes-

senger 2268 (VGAM2268) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[31708] VGAM2268 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2268 was detected is described hereinabove with reference to Figs. 2-8.

[31709] VGAM2268 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Alcelaphine herpesvirus 1. VGAM2268 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[31710] VGAM2268 gene, herein designated VGAM GENE, encodes a VGAM2268 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2268 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2268 precursor RNA is designated SEQ ID:2254, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2254 is located at position

29021 relative to the genome of Alcelaphine herpesvirus 1.

[31711] VGAM2268 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2268 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[31712] An enzyme complex designated DICER COMPLEX, dices the VGAM2268 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2268 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM2268 RNA is designated SEQ ID:4979, and is provided hereinbelow with reference to the sequence

listing part.

[31713] VGAM2268 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2268 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2268 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[31714] VGAM2268 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2268 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2268 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not

meant to be limiting VGAM2268 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2268 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[31715] The complementary binding of VGAM2268 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2268 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2268 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2268 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[31716] It is appreciated that VGAM2268 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2268 host target genes. The mRNA of each one of this plurality of VGAM2268 host target genes comprises one or more host target binding sites, each

having a nucleotide sequence which is at least partly complementary to VGAM2268 RNA, herein designated VGAM RNA, and which when bound by VGAM2268 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2268 host target proteins.

[31717] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2268 gene, herein designated VGAM GENE, on one or more VGAM2268 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[31718] It is yet further appreciated that a function of VGAM2268

is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2268 include diagnosis, prevention and treatment of viral infection by Alcelaphine herpesvirus 1. Specific functions, and accordingly utilities, of VGAM2268 correlate with, and may be deduced from, the identity of the host target genes which VGAM2268 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[31719] Nucleotide sequences of the VGAM2268 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2268 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2268 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2268 are further described hereinbelow with reference to Table 1.

[31720] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2268 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[31721] Fig. 1 further provides a conceptual description of another

novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2269 (VGAM2269) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[31722] VGAM2269 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2269 was detected is described hereinabove with reference to Figs. 2-8.

[31723] VGAM2269 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Alcelaphine herpesvirus 1. VGAM2269 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[31724] VGAM2269 gene, herein designated VGAM GENE, encodes a VGAM2269 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2269 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2269 precursor RNA is designated SEQ ID:2255, and is provided here-

inbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2255 is located at position 30842 relative to the genome of Alcelaphine herpesvirus 1.

[31725] VGAM2269 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2269 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[31726] An enzyme complex designated DICER COMPLEX, dices the VGAM2269 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2269 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 59%) nucleotide se-

quence of VGAM2269 RNA is designated SEQ ID:4980, and is provided hereinbelow with reference to the sequence listing part.

[31727] VGAM2269 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2269 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2269 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[31728] VGAM2269 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2269 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2269 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is ap-

preciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2269 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2269 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[31729] The complementary binding of VGAM2269 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2269 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2269 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2269 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[31730] It is appreciated that VGAM2269 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2269 host target genes. The mRNA of

each one of this plurality of VGAM2269 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2269 RNA, herein designated VGAM RNA, and which when bound by VGAM2269 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2269 host target proteins.

[31731] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2269 gene, herein designated VGAM GENE, on one or more VGAM2269 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science

294,779 (2001)).

[31732] It is yet further appreciated that a function of VGAM2269 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2269 include diagnosis, prevention and treatment of viral infection by Alcelaphine herpesvirus 1. Specific functions, and accordingly utilities, of VGAM2269 correlate with, and may be deduced from, the identity of the host target genes which VGAM2269 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[31733] Nucleotide sequences of the VGAM2269 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2269 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2269 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2269 are further described hereinbelow with reference to Table 1.

[31734] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2269 RNA, herein designated VGAM RNA, are de-

scribed hereinbelow with reference to Table 2.

[31735] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2270 (VGAM2270) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[31736] VGAM2270 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2270 was detected is described hereinabove with reference to Figs. 2-8.

[31737] VGAM2270 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Alcelaphine herpesvirus 1. VGAM2270 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[31738] VGAM2270 gene, herein designated VGAM GENE, encodes a VGAM2270 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2270 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly

similar to the nucleotide sequence of VGAM2270 precursor RNA is designated SEQ ID:2256, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2256 is located at position 26539 relative to the genome of Alcelaphine herpesvirus 1.

[31739] VGAM2270 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2270 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[31740] An enzyme complex designated DICER COMPLEX, dices the VGAM2270 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2270 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer together with other necessary proteins. A probable (over 45%) nucleotide sequence of VGAM2270 RNA is designated SEQ ID:4981, and is provided hereinbelow with reference to the sequence listing part.

[31741] VGAM2270 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2270 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2270 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[31742] VGAM2270 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2270 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2270 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3

such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2270 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2270 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[31743] The complementary binding of VGAM2270 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2270 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2270 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2270 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[31744] It is appreciated that VGAM2270 host target gene, herein

designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2270 host target genes. The mRNA of each one of this plurality of VGAM2270 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2270 RNA, herein designated VGAM RNA, and which when bound by VGAM2270 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2270 host target proteins.

[31745] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2270 gene, herein designated VGAM GENE, on one or more VGAM2270 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these

other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[31746] It is yet further appreciated that a function of VGAM2270 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2270 include diagnosis, prevention and treatment of viral infection by Alcelaphine herpesvirus 1. Specific functions, and accordingly utilities, of VGAM2270 correlate with, and may be deduced from, the identity of the host target genes which VGAM2270 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[31747] Nucleotide sequences of the VGAM2270 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2270 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2270 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2270 are further described hereinbelow with reference to Table 1.

[31748] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the

complementarity of each of these host target binding sites to VGAM2270 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[31749] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2271 (VGAM2271) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[31750] VGAM2271 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2271 was detected is described hereinabove with reference to Figs. 2-8.

[31751] VGAM2271 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Alcelaphine herpesvirus 1. VGAM2271 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[31752] VGAM2271 gene, herein designated VGAM GENE, encodes a VGAM2271 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2271 precursor RNA,

herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2271 precursor RNA is designated SEQ ID:2257, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2257 is located at position 29858 relative to the genome of Alcelaphine herpesvirus 1.

[31753] VGAM2271 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2271 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[31754] An enzyme complex designated DICER COMPLEX, dices the VGAM2271 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2271 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a

hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide sequence of VGAM2271 RNA is designated SEQ ID:4982, and is provided hereinbelow with reference to the sequence listing part.

[31755] VGAM2271 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2271 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2271 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[31756] VGAM2271 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2271 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2271 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed

sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2271 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2271 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[31757] The complementary binding of VGAM2271 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2271 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2271 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2271 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target

protein is therefore outlined by a broken line.

[31758] It is appreciated that VGAM2271 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2271 host target genes. The mRNA of each one of this plurality of VGAM2271 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2271 RNA, herein designated VGAM RNA, and which when bound by VGAM2271 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2271 host target proteins.

[31759] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2271 gene, herein designated VGAM GENE, on one or more VGAM2271 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate ex-

pression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[31760] It is yet further appreciated that a function of VGAM2271 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2271 include diagnosis, prevention and treatment of viral infection by Alcelaphine herpesvirus 1. Specific functions, and accordingly utilities, of VGAM2271 correlate with, and may be deduced from, the identity of the host target genes which VGAM2271 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[31761] Nucleotide sequences of the VGAM2271 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2271 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2271 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2271 are further described hereinbelow with reference to Table 1.

[31762] Nucleotide sequences of host target binding sites, such as

BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2271 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[31763] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2272 (VGAM2272) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[31764] VGAM2272 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2272 was detected is described hereinabove with reference to Figs. 2-8.

[31765] VGAM2272 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Alcelaphine herpesvirus 1. VGAM2272 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[31766] VGAM2272 gene, herein designated VGAM GENE, encodes a VGAM2272 precursor RNA, herein designated VGAM

PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2272 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2272 precursor RNA is designated SEQ ID:2258, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2258 is located at position 18433 relative to the genome of Alcelaphine herpesvirus 1.

[31767] VGAM2272 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2272 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[31768] An enzyme complex designated DICER COMPLEX, dices the VGAM2272 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2272 RNA,

herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM2272 RNA is designated SEQ ID:4983, and is provided hereinbelow with reference to the sequence listing part.

[31769] VGAM2272 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2272 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2272 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[31770] VGAM2272 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2272 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nu-

cleotide sequence of VGAM2272 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2272 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2272 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[31771] The complementary binding of VGAM2272 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2272 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2272 host target RNA, herein designated VGAM HOST TARGET

RNA, into VGAM2272 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[31772] It is appreciated that VGAM2272 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2272 host target genes. The mRNA of each one of this plurality of VGAM2272 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2272 RNA, herein designated VGAM RNA, and which when bound by VGAM2272 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2272 host target proteins.

[31773] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2272 gene, herein designated VGAM GENE, on one or more VGAM2272 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4

and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[31774] It is yet further appreciated that a function of VGAM2272 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2272 include diagnosis, prevention and treatment of viral infection by Alcelaphine herpesvirus 1. Specific functions, and accordingly utilities, of VGAM2272 correlate with, and may be deduced from, the identity of the host target genes which VGAM2272 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[31775] Nucleotide sequences of the VGAM2272 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2272 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2272 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2272 are further

described hereinbelow with reference to Table 1.

[31776] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2272 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[31777] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2273 (VGAM2273) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[31778] VGAM2273 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2273 was detected is described hereinabove with reference to Figs. 2-8.

[31779] VGAM2273 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Alcelaphine herpesvirus 1. VGAM2273 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[31780] VGAM2273 gene, herein designated VGAM GENE, encodes a VGAM2273 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2273 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2273 precursor RNA is designated SEQ ID:2259, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2259 is located at position 28077 relative to the genome of Alcelaphine herpesvirus 1.

[31781] VGAM2273 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2273 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[31782] An enzyme complex designated DICER COMPLEX, dices

the VGAM2273 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2273 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of VGAM2273 RNA is designated SEQ ID:4984, and is provided hereinbelow with reference to the sequence listing part.

[31783] VGAM2273 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2273 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2273 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[31784] VGAM2273 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2273 host target

RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2273 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2273 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2273 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[31785] The complementary binding of VGAM2273 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2273 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE

II and BINDING SITE III, inhibits translation of VGAM2273 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2273 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[31786] It is appreciated that VGAM2273 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2273 host target genes. The mRNA of each one of this plurality of VGAM2273 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2273 RNA, herein designated VGAM RNA, and which when bound by VGAM2273 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2273 host target proteins.

[31787] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2273 gene, herein designated VGAM GENE, on one or more VGAM2273 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a spe-

cific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[31788] It is yet further appreciated that a function of VGAM2273 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2273 include diagnosis, prevention and treatment of viral infection by Alcelaphine herpesvirus 1. Specific functions, and accordingly utilities, of VGAM2273 correlate with, and may be deduced from, the identity of the host target genes which VGAM2273 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[31789] Nucleotide sequences of the VGAM2273 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2273 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of

VGAM2273 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2273 are further described hereinbelow with reference to Table 1.

[31790] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2273 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[31791] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2274 (VGAM2274) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[31792] VGAM2274 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2274 was detected is described hereinabove with reference to Figs. 2-8.

[31793] VGAM2274 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Alcelaphine herpesvirus 1. VGAM2274 host target gene, herein designated VGAM

HOST TARGET GENE, is a human gene contained in the human genome.

[31794] VGAM2274 gene, herein designated VGAM GENE, encodes a VGAM2274 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2274 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2274 precursor RNA is designated SEQ ID:2260, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2260 is located at position 31577 relative to the genome of Alcelaphine herpesvirus 1.

[31795] VGAM2274 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2274 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of

the second half thereof.

[31796] An enzyme complex designated DICER COMPLEX, dices the VGAM2274 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2274 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 44%) nucleotide sequence of VGAM2274 RNA is designated SEQ ID:4985, and is provided hereinbelow with reference to the sequence listing part.

[31797] VGAM2274 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2274 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2274 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[31798] VGAM2274 RNA, herein designated VGAM RNA, binds

complementarily to one or more host target binding sites located in untranslated regions of VGAM2274 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2274 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2274 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2274 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[31799] The complementary binding of VGAM2274 RNA, herein designated VGAM RNA, to host target binding sites on

VGAM2274 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2274 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2274 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[31800] It is appreciated that VGAM2274 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2274 host target genes. The mRNA of each one of this plurality of VGAM2274 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2274 RNA, herein designated VGAM RNA, and which when bound by VGAM2274 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2274 host target proteins.

[31801] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2274 gene, herein designated VGAM GENE, on one or more VGAM2274 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other

known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[31802] It is yet further appreciated that a function of VGAM2274 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2274 include diagnosis, prevention and treatment of viral infection by Alcelaphine herpesvirus 1. Specific functions, and accordingly utilities, of VGAM2274 correlate with, and may be deduced from, the identity of the host target genes which VGAM2274 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[31803] Nucleotide sequences of the VGAM2274 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the

diced VGAM2274 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2274 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2274 are further described hereinbelow with reference to Table 1.

[31804] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2274 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[31805] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2275 (VGAM2275) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[31806] VGAM2275 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2275 was detected is described hereinabove with reference to Figs. 2-8.

[31807] VGAM2275 gene, herein designated VGAM GENE, is a viral

gene contained in the genome of Alcelaphine herpesvirus 1. VGAM2275 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[31808] VGAM2275 gene, herein designated VGAM GENE, encodes a VGAM2275 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2275 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2275 precursor RNA is designated SEQ ID:2261, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2261 is located at position 30158 relative to the genome of Alcelaphine herpesvirus 1.

[31809] VGAM2275 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2275 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the

RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[31810] An enzyme complex designated DICER COMPLEX, dices the VGAM2275 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2275 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM2275 RNA is designated SEQ ID:4986, and is provided hereinbelow with reference to the sequence listing part.

[31811] VGAM2275 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2275 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2275 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN COD-

ING and 3UTR respectively.

[31812] VGAM2275 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2275 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2275 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2275 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2275 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[31813] The complementary binding of VGAM2275 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2275 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2275 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2275 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[31814] It is appreciated that VGAM2275 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2275 host target genes. The mRNA of each one of this plurality of VGAM2275 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2275 RNA, herein designated VGAM RNA, and which when bound by VGAM2275 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2275 host target proteins.

[31815] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2275 gene, herein designated VGAM GENE, on one

or more VGAM2275 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[31816] It is yet further appreciated that a function of VGAM2275 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2275 include diagnosis, prevention and treatment of viral infection by Alcelaphine herpesvirus 1. Specific functions, and accordingly utilities, of VGAM2275 correlate with, and may be deduced from, the identity of the host target genes which VGAM2275 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[31817] Nucleotide sequences of the VGAM2275 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2275 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2275 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2275 are further described hereinbelow with reference to Table 1.

[31818] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2275 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[31819] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2276 (VGAM2276) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[31820] VGAM2276 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2276 was detected is de-

scribed hereinabove with reference to Figs. 2-8.

[31821] VGAM2276 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Alcelaphine herpesvirus 1. VGAM2276 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[31822] VGAM2276 gene, herein designated VGAM GENE, encodes a VGAM2276 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2276 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2276 precursor RNA is designated SEQ ID:2262, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2262 is located at position 30027 relative to the genome of Alcelaphine herpesvirus 1.

[31823] VGAM2276 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2276 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typi-

cal of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[31824] An enzyme complex designated DICER COMPLEX, dices the VGAM2276 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2276 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 60%) nucleotide sequence of VGAM2276 RNA is designated SEQ ID:4987, and is provided hereinbelow with reference to the sequence listing part.

[31825] VGAM2276 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2276 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2276 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding

gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[31826] VGAM2276 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2276 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2276 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2276 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2276 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be lo-

cated in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[31827] The complementary binding of VGAM2276 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2276 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2276 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2276 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[31828] It is appreciated that VGAM2276 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2276 host target genes. The mRNA of each one of this plurality of VGAM2276 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2276 RNA, herein designated VGAM RNA, and which when bound by VGAM2276 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2276 host target proteins.

[31829] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with

specific reference to translational inhibition exerted by VGAM2276 gene, herein designated VGAM GENE, on one or more VGAM2276 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[31830] It is yet further appreciated that a function of VGAM2276 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2276 include diagnosis, prevention and treatment of viral infection by Alcelaphine herpesvirus 1. Specific functions, and accordingly utilities, of VGAM2276 correlate with, and may be deduced from, the identity of the host target genes which VGAM2276 binds and in-

hibits, and the function of these host target genes, as elaborated hereinbelow.

[31831] Nucleotide sequences of the VGAM2276 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2276 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2276 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2276 are further described hereinbelow with reference to Table 1.

[31832] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2276 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[31833] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2277 (VGAM2277) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[31834] VGAM2277 is a novel bioinformatically detected regula-

tory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2277 was detected is described hereinabove with reference to Figs. 2-8.

[31835] VGAM2277 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Alcelaphine herpesvirus 1. VGAM2277 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[31836] VGAM2277 gene, herein designated VGAM GENE, encodes a VGAM2277 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2277 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2277 precursor RNA is designated SEQ ID:2263, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2263 is located at position 27286 relative to the genome of Alcelaphine herpesvirus 1.

[31837] VGAM2277 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2277 folded precursor RNA, herein designated VGAM FOLDED PRECUR-

SOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[31838] An enzyme complex designated DICER COMPLEX, dices the VGAM2277 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2277 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide sequence of VGAM2277 RNA is designated SEQ ID:4988, and is provided hereinbelow with reference to the sequence listing part.

[31839] VGAM2277 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2277 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2277 host target RNA,

herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[31840] VGAM2277 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2277 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2277 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2277 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2277 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host tar-

get binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[31841] The complementary binding of VGAM2277 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2277 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2277 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2277 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[31842] It is appreciated that VGAM2277 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2277 host target genes. The mRNA of each one of this plurality of VGAM2277 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2277 RNA, herein designated VGAM RNA, and which when bound by VGAM2277 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2277 host target proteins.

[31843] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2277 gene, herein designated VGAM GENE, on one or more VGAM2277 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[31844] It is yet further appreciated that a function of VGAM2277 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2277 include diagnosis, prevention and treatment of viral infection by Alcelaphine herpesvirus 1. Specific functions, and accordingly utilities, of VGAM2277

correlate with, and may be deduced from, the identity of the host target genes which VGAM2277 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[31845] Nucleotide sequences of the VGAM2277 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2277 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2277 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2277 are further described hereinbelow with reference to Table 1.

[31846] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2277 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[31847] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2278 (VGAM2278) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the

art.

[31848] VGAM2278 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2278 was detected is described hereinabove with reference to Figs. 2-8.

[31849] VGAM2278 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Alcelaphine herpesvirus 1. VGAM2278 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[31850] VGAM2278 gene, herein designated VGAM GENE, encodes a VGAM2278 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2278 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2278 precursor RNA is designated SEQ ID:2264, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2264 is located at position 29724 relative to the genome of Alcelaphine herpesvirus 1.

[31851] VGAM2278 precursor RNA, herein designated VGAM PRE-

CURSOR RNA, folds onto itself, forming VGAM2278 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[31852] An enzyme complex designated DICER COMPLEX, dices the VGAM2278 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2278 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 45%) nucleotide sequence of VGAM2278 RNA is designated SEQ ID:4989, and is provided hereinbelow with reference to the sequence listing part.

[31853] VGAM2278 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger

RNA, VGAM2278 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2278 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[31854] VGAM2278 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2278 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2278 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2278 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2278 host

target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[31855] The complementary binding of VGAM2278 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2278 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2278 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2278 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[31856] It is appreciated that VGAM2278 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2278 host target genes. The mRNA of each one of this plurality of VGAM2278 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2278 RNA, herein designated VGAM RNA, and which when bound by VGAM2278 RNA, herein

designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2278 host target proteins.

[31857] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2278 gene, herein designated VGAM GENE, on one or more VGAM2278 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[31858] It is yet further appreciated that a function of VGAM2278 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2278 include diagnosis, prevention and

treatment of viral infection by Alcelaphine herpesvirus 1. Specific functions, and accordingly utilities, of VGAM2278 correlate with, and may be deduced from, the identity of the host target genes which VGAM2278 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[31859] Nucleotide sequences of the VGAM2278 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2278 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2278 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2278 are further described hereinbelow with reference to Table 1.

[31860] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2278 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[31861] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2279 (VGAM2279) viral gene, which modulates ex-

pression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[31862] VGAM2279 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2279 was detected is described hereinabove with reference to Figs. 2-8.

[31863] VGAM2279 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Alcelaphine herpesvirus 1. VGAM2279 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[31864] VGAM2279 gene, herein designated VGAM GENE, encodes a VGAM2279 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2279 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2279 precursor RNA is designated SEQ ID:2265, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2265 is located at position 26039 relative to the genome of Alcelaphine herpesvirus

1.

[31865] VGAM2279 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2279 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[31866] An enzyme complex designated DICER COMPLEX, dices the VGAM2279 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2279 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 49%) nucleotide sequence of VGAM2279 RNA is designated SEQ ID:4990, and is provided hereinbelow with reference to the sequence listing part.

[31867] VGAM2279 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2279 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2279 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[31868] VGAM2279 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2279 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2279 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2279 RNA, herein designated

VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2279 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[31869] The complementary binding of VGAM2279 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2279 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2279 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2279 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[31870] It is appreciated that VGAM2279 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2279 host target genes. The mRNA of each one of this plurality of VGAM2279 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly com-

plementary to VGAM2279 RNA, herein designated VGAM RNA, and which when bound by VGAM2279 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2279 host target proteins.

[31871] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2279 gene, herein designated VGAM GENE, on one or more VGAM2279 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[31872] It is yet further appreciated that a function of VGAM2279 is inhibition of expression of host target genes, as part of

a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2279 include diagnosis, prevention and treatment of viral infection by Alcelaphine herpesvirus 1. Specific functions, and accordingly utilities, of VGAM2279 correlate with, and may be deduced from, the identity of the host target genes which VGAM2279 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[31873] Nucleotide sequences of the VGAM2279 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2279 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2279 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2279 are further described hereinbelow with reference to Table 1.

[31874] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2279 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[31875] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present

invention, referred to here as Viral Genomic Address Messenger 2280 (VGAM2280) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[31876] VGAM2280 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2280 was detected is described hereinabove with reference to Figs. 2-8.

[31877] VGAM2280 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Alcelaphine herpesvirus 1. VGAM2280 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[31878] VGAM2280 gene, herein designated VGAM GENE, encodes a VGAM2280 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2280 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2280 precursor RNA is designated SEQ ID:2266, and is provided hereinbelow with reference to the sequence listing part. Nu-

cleotide sequence SEQ ID:2266 is located at position 27049 relative to the genome of Alcelaphine herpesvirus 1.

[31879] VGAM2280 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2280 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[31880] An enzyme complex designated DICER COMPLEX, dices the VGAM2280 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2280 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 44%) nucleotide sequence of VGAM2280 RNA is designated SEQ ID:4991, and

is provided hereinbelow with reference to the sequence listing part.

[31881] VGAM2280 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2280 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2280 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[31882] VGAM2280 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2280 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2280 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites

shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2280 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2280 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[31883] The complementary binding of VGAM2280 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2280 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2280 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2280 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[31884] It is appreciated that VGAM2280 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2280 host target genes. The mRNA of each one of this plurality of VGAM2280 host target genes

comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2280 RNA, herein designated VGAM RNA, and which when bound by VGAM2280 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2280 host target proteins.

[31885] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2280 gene, herein designated VGAM GENE, on one or more VGAM2280 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[31886] It is yet further appreciated that a function of VGAM2280 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2280 include diagnosis, prevention and treatment of viral infection by Alcelaphine herpesvirus 1. Specific functions, and accordingly utilities, of VGAM2280 correlate with, and may be deduced from, the identity of the host target genes which VGAM2280 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[31887] Nucleotide sequences of the VGAM2280 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2280 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2280 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2280 are further described hereinbelow with reference to Table 1.

[31888] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2280 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[31889] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2281 (VGAM2281) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[31890] VGAM2281 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2281 was detected is described hereinabove with reference to Figs. 2-8.

[31891] VGAM2281 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Murine hepatitis virus. VGAM2281 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[31892] VGAM2281 gene, herein designated VGAM GENE, encodes a VGAM2281 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2281 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2281 precur-

sor RNA is designated SEQ ID:2267, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2267 is located at position 22070 relative to the genome of Murine hepatitis virus.

[31893] VGAM2281 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2281 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[31894] An enzyme complex designated DICER COMPLEX, dices the VGAM2281 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2281 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide se-

quence of VGAM2281 RNA is designated SEQ ID:4992, and is provided hereinbelow with reference to the sequence listing part.

[31895] VGAM2281 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2281 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2281 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[31896] VGAM2281 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2281 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2281 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is ap-

preciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2281 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2281 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[31897] The complementary binding of VGAM2281 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2281 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2281 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2281 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[31898] It is appreciated that VGAM2281 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2281 host target genes. The mRNA of

each one of this plurality of VGAM2281 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2281 RNA, herein designated VGAM RNA, and which when bound by VGAM2281 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2281 host target proteins.

[31899] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2281 gene, herein designated VGAM GENE, on one or more VGAM2281 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science

294,779 (2001)).

[31900] It is yet further appreciated that a function of VGAM2281 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2281 include diagnosis, prevention and treatment of viral infection by Murine hepatitis virus. Specific functions, and accordingly utilities, of VGAM2281 correlate with, and may be deduced from, the identity of the host target genes which VGAM2281 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[31901] Nucleotide sequences of the VGAM2281 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2281 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2281 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2281 are further described hereinbelow with reference to Table 1.

[31902] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2281 RNA, herein designated VGAM RNA, are de-

scribed hereinbelow with reference to Table 2.

[31903] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2282 (VGAM2282) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[31904] VGAM2282 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2282 was detected is described hereinabove with reference to Figs. 2-8.

[31905] VGAM2282 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Murine hepatitis virus. VGAM2282 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[31906] VGAM2282 gene, herein designated VGAM GENE, encodes a VGAM2282 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2282 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly

similar to the nucleotide sequence of VGAM2282 precursor RNA is designated SEQ ID:2268, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2268 is located at position 26667 relative to the genome of Murine hepatitis virus.

[31907] VGAM2282 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2282 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[31908] An enzyme complex designated DICER COMPLEX, dices the VGAM2282 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2282 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other

necessary proteins. A probable (over 45%) nucleotide sequence of VGAM2282 RNA is designated SEQ ID:4993, and is provided hereinbelow with reference to the sequence listing part.

[31909] VGAM2282 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2282 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2282 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[31910] VGAM2282 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2282 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2282 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I,

BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2282 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2282 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[31911] The complementary binding of VGAM2282 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2282 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2282 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2282 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[31912] It is appreciated that VGAM2282 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents

a plurality of VGAM2282 host target genes. The mRNA of each one of this plurality of VGAM2282 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2282 RNA, herein designated VGAM RNA, and which when bound by VGAM2282 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2282 host target proteins.

[31913] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2282 gene, herein designated VGAM GENE, on one or more VGAM2282 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[31914] It is yet further appreciated that a function of VGAM2282 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2282 include diagnosis, prevention and treatment of viral infection by Murine hepatitis virus. Specific functions, and accordingly utilities, of VGAM2282 correlate with, and may be deduced from, the identity of the host target genes which VGAM2282 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[31915] Nucleotide sequences of the VGAM2282 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2282 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2282 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2282 are further described hereinbelow with reference to Table 1.

[31916] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites

to VGAM2282 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[31917] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2283 (VGAM2283) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[31918] VGAM2283 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2283 was detected is described hereinabove with reference to Figs. 2-8.

[31919] VGAM2283 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Murine hepatitis virus. VGAM2283 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[31920] VGAM2283 gene, herein designated VGAM GENE, encodes a VGAM2283 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2283 precursor RNA, herein designated VGAM PRECURSOR RNA, does not en-

code a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2283 precursor RNA is designated SEQ ID:2269, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2269 is located at position 23988 relative to the genome of Murine hepatitis virus.

[31921] VGAM2283 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2283 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[31922] An enzyme complex designated DICER COMPLEX, dices the VGAM2283 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2283 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer together with other necessary proteins. A probable (over 45%) nucleotide sequence of VGAM2283 RNA is designated SEQ ID:4994, and is provided hereinbelow with reference to the sequence listing part.

[31923] VGAM2283 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2283 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2283 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[31924] VGAM2283 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2283 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2283 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3

such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2283 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2283 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[31925] The complementary binding of VGAM2283 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2283 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2283 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2283 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[31926] It is appreciated that VGAM2283 host target gene, herein

designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2283 host target genes. The mRNA of each one of this plurality of VGAM2283 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2283 RNA, herein designated VGAM RNA, and which when bound by VGAM2283 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2283 host target proteins.

[31927] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2283 gene, herein designated VGAM GENE, on one or more VGAM2283 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these

other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[31928] It is yet further appreciated that a function of VGAM2283 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2283 include diagnosis, prevention and treatment of viral infection by Murine hepatitis virus. Specific functions, and accordingly utilities, of VGAM2283 correlate with, and may be deduced from, the identity of the host target genes which VGAM2283 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[31929] Nucleotide sequences of the VGAM2283 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2283 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2283 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2283 are further described hereinbelow with reference to Table 1.

[31930] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the

complementarity of each of these host target binding sites to VGAM2283 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[31931] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2284 (VGAM2284) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[31932] VGAM2284 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2284 was detected is described hereinabove with reference to Figs. 2-8.

[31933] VGAM2284 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Murine hepatitis virus. VGAM2284 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[31934] VGAM2284 gene, herein designated VGAM GENE, encodes a VGAM2284 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2284 precursor RNA,

herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2284 precursor RNA is designated SEQ ID:2270, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2270 is located at position 22470 relative to the genome of Murine hepatitis virus.

[31935] VGAM2284 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2284 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[31936] An enzyme complex designated DICER COMPLEX, dices the VGAM2284 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2284 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short

~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide sequence of VGAM2284 RNA is designated SEQ ID:4995, and is provided hereinbelow with reference to the sequence listing part.

[31937] VGAM2284 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2284 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2284 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[31938] VGAM2284 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2284 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2284 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host

target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2284 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2284 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[31939] The complementary binding of VGAM2284 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2284 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2284 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2284 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[31940] It is appreciated that VGAM2284 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2284 host target genes. The mRNA of each one of this plurality of VGAM2284 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2284 RNA, herein designated VGAM RNA, and which when bound by VGAM2284 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2284 host target proteins.

[31941] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2284 gene, herein designated VGAM GENE, on one or more VGAM2284 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, al-

though specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[31942] It is yet further appreciated that a function of VGAM2284 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2284 include diagnosis, prevention and treatment of viral infection by Murine hepatitis virus. Specific functions, and accordingly utilities, of VGAM2284 correlate with, and may be deduced from, the identity of the host target genes which VGAM2284 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[31943] Nucleotide sequences of the VGAM2284 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2284 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2284 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2284 are further described hereinbelow with reference to Table 1.

[31944] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of

Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2284 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[31945] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2285 (VGAM2285) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[31946] VGAM2285 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2285 was detected is described hereinabove with reference to Figs. 2-8.

[31947] VGAM2285 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Murine hepatitis virus. VGAM2285 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[31948] VGAM2285 gene, herein designated VGAM GENE, encodes a VGAM2285 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and un-

like most ordinary genes, VGAM2285 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2285 precursor RNA is designated SEQ ID:2271, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2271 is located at position 13151 relative to the genome of Murine hepatitis virus.

[31949] VGAM2285 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2285 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[31950] An enzyme complex designated DICER COMPLEX, dices the VGAM2285 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2285 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a

hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 46%) nucleotide sequence of VGAM2285 RNA is designated SEQ ID:4996, and is provided hereinbelow with reference to the sequence listing part.

[31951] VGAM2285 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2285 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2285 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[31952] VGAM2285 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2285 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2285 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed

sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2285 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2285 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[31953] The complementary binding of VGAM2285 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2285 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2285 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2285 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target

protein is therefore outlined by a broken line.

[31954] It is appreciated that VGAM2285 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2285 host target genes. The mRNA of each one of this plurality of VGAM2285 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2285 RNA, herein designated VGAM RNA, and which when bound by VGAM2285 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2285 host target proteins.

[31955] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2285 gene, herein designated VGAM GENE, on one or more VGAM2285 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate ex-

pression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[31956] It is yet further appreciated that a function of VGAM2285 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2285 include diagnosis, prevention and treatment of viral infection by Murine hepatitis virus. Specific functions, and accordingly utilities, of VGAM2285 correlate with, and may be deduced from, the identity of the host target genes which VGAM2285 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[31957] Nucleotide sequences of the VGAM2285 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2285 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2285 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2285 are further described hereinbelow with reference to Table 1.

[31958] Nucleotide sequences of host target binding sites, such as

BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2285 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[31959] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2286 (VGAM2286) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[31960] VGAM2286 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2286 was detected is described hereinabove with reference to Figs. 2-8.

[31961] VGAM2286 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Murine hepatitis virus. VGAM2286 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[31962] VGAM2286 gene, herein designated VGAM GENE, encodes a VGAM2286 precursor RNA, herein designated VGAM

PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2286 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2286 precursor RNA is designated SEQ ID:2272, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2272 is located at position 4778 relative to the genome of Murine hepatitis virus.

[31963] VGAM2286 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2286 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[31964] An enzyme complex designated DICER COMPLEX, dices the VGAM2286 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2286 RNA, herein designated VGAM RNA, a single stranded ~22 nt

long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 54%) nucleotide sequence of VGAM2286 RNA is designated SEQ ID:4997, and is provided hereinbelow with reference to the sequence listing part.

[31965] VGAM2286 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2286 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2286 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[31966] VGAM2286 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2286 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2286 RNA, herein designated

VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2286 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2286 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[31967] The complementary binding of VGAM2286 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2286 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2286 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2286 host target protein, herein desig-

nated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[31968] It is appreciated that VGAM2286 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2286 host target genes. The mRNA of each one of this plurality of VGAM2286 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2286 RNA, herein designated VGAM RNA, and which when bound by VGAM2286 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2286 host target proteins.

[31969] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2286 gene, herein designated VGAM GENE, on one or more VGAM2286 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are

also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[31970] It is yet further appreciated that a function of VGAM2286 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2286 include diagnosis, prevention and treatment of viral infection by Murine hepatitis virus. Specific functions, and accordingly utilities, of VGAM2286 correlate with, and may be deduced from, the identity of the host target genes which VGAM2286 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[31971] Nucleotide sequences of the VGAM2286 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2286 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2286 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2286 are further described hereinbelow with reference to Table 1.

[31972] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2286 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[31973] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2287 (VGAM2287) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[31974] VGAM2287 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2287 was detected is described hereinabove with reference to Figs. 2-8.

[31975] VGAM2287 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Murine hepatitis virus. VGAM2287 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[31976] VGAM2287 gene, herein designated VGAM GENE, encodes

a VGAM2287 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2287 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2287 precursor RNA is designated SEQ ID:2273, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2273 is located at position 3614 relative to the genome of Murine hepatitis virus.

[31977] VGAM2287 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2287 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[31978] An enzyme complex designated DICER COMPLEX, dices the VGAM2287 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2287 RNA,

herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM2287 RNA is designated SEQ ID:4998, and is provided hereinbelow with reference to the sequence listing part.

[31979] VGAM2287 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2287 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2287 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[31980] VGAM2287 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2287 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nu-

cleotide sequence of VGAM2287 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2287 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2287 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[31981] The complementary binding of VGAM2287 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2287 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2287 host target RNA, herein designated VGAM HOST TARGET

RNA, into VGAM2287 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[31982] It is appreciated that VGAM2287 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2287 host target genes. The mRNA of each one of this plurality of VGAM2287 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2287 RNA, herein designated VGAM RNA, and which when bound by VGAM2287 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2287 host target proteins.

[31983] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2287 gene, herein designated VGAM GENE, on one or more VGAM2287 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4

and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[31984] It is yet further appreciated that a function of VGAM2287 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2287 include diagnosis, prevention and treatment of viral infection by Murine hepatitis virus. Specific functions, and accordingly utilities, of VGAM2287 correlate with, and may be deduced from, the identity of the host target genes which VGAM2287 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[31985] Nucleotide sequences of the VGAM2287 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2287 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2287 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2287 are further

described hereinbelow with reference to Table 1.

[31986] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2287 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[31987] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2288 (VGAM2288) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[31988] VGAM2288 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2288 was detected is described hereinabove with reference to Figs. 2-8.

[31989] VGAM2288 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Murine hepatitis virus. VGAM2288 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[31990] VGAM2288 gene, herein designated VGAM GENE, encodes a VGAM2288 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2288 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2288 precursor RNA is designated SEQ ID:2274, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2274 is located at position 23052 relative to the genome of Murine hepatitis virus.

[31991] VGAM2288 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2288 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[31992] An enzyme complex designated DICER COMPLEX, dices the VGAM2288 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, into VGAM2288 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM2288 RNA is designated SEQ ID:4999, and is provided hereinbelow with reference to the sequence listing part.

[31993] VGAM2288 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2288 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2288 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[31994] VGAM2288 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2288 host target RNA, herein designated VGAM HOST TARGET RNA. This

complementary binding is due to the fact that the nucleotide sequence of VGAM2288 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2288 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2288 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[31995] The complementary binding of VGAM2288 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2288 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2288

host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2288 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[31996] It is appreciated that VGAM2288 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2288 host target genes. The mRNA of each one of this plurality of VGAM2288 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2288 RNA, herein designated VGAM RNA, and which when bound by VGAM2288 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2288 host target proteins.

[31997] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2288 gene, herein designated VGAM GENE, on one or more VGAM2288 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated

only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[31998] It is yet further appreciated that a function of VGAM2288 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2288 include diagnosis, prevention and treatment of viral infection by Murine hepatitis virus. Specific functions, and accordingly utilities, of VGAM2288 correlate with, and may be deduced from, the identity of the host target genes which VGAM2288 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[31999] Nucleotide sequences of the VGAM2288 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2288 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2288 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, of VGAM2288 are further described hereinbelow with reference to Table 1.

[32000] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2288 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[32001] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2289 (VGAM2289) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[32002] VGAM2289 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2289 was detected is described hereinabove with reference to Figs. 2-8.

[32003] VGAM2289 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Murine hepatitis virus. VGAM2289 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the

human genome.

[32004] VGAM2289 gene, herein designated VGAM GENE, encodes a VGAM2289 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2289 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2289 precursor RNA is designated SEQ ID:2275, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2275 is located at position 12369 relative to the genome of Murine hepatitis virus.

[32005] VGAM2289 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2289 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[32006] An enzyme complex designated DICER COMPLEX, dices

the VGAM2289 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2289 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide sequence of VGAM2289 RNA is designated SEQ ID:5000, and is provided hereinbelow with reference to the sequence listing part.

[32007] VGAM2289 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2289 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2289 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[32008] VGAM2289 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2289 host target

RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2289 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2289 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2289 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[32009] The complementary binding of VGAM2289 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2289 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE

II and BINDING SITE III, inhibits translation of VGAM2289 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2289 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[32010] It is appreciated that VGAM2289 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2289 host target genes. The mRNA of each one of this plurality of VGAM2289 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2289 RNA, herein designated VGAM RNA, and which when bound by VGAM2289 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2289 host target proteins.

[32011] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2289 gene, herein designated VGAM GENE, on one or more VGAM2289 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a spe-

cific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[32012] It is yet further appreciated that a function of VGAM2289 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2289 include diagnosis, prevention and treatment of viral infection by Murine hepatitis virus. Specific functions, and accordingly utilities, of VGAM2289 correlate with, and may be deduced from, the identity of the host target genes which VGAM2289 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[32013] Nucleotide sequences of the VGAM2289 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2289 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of

VGAM2289 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2289 are further described hereinbelow with reference to Table 1.

[32014] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2289 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[32015] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2290 (VGAM2290) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[32016] VGAM2290 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2290 was detected is described hereinabove with reference to Figs. 2-8.

[32017] VGAM2290 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Murine hepatitis virus. VGAM2290 host target gene, herein designated VGAM

HOST TARGET GENE, is a human gene contained in the human genome.

[32018] VGAM2290 gene, herein designated VGAM GENE, encodes a VGAM2290 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2290 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2290 precursor RNA is designated SEQ ID:2276, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2276 is located at position 16166 relative to the genome of Murine hepatitis virus.

[32019] VGAM2290 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2290 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[32020] An enzyme complex designated DICER COMPLEX, dices the VGAM2290 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2290 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM2290 RNA is designated SEQ ID:5001, and is provided hereinbelow with reference to the sequence listing part.

[32021] VGAM2290 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2290 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2290 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[32022] VGAM2290 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites

located in untranslated regions of VGAM2290 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2290 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2290 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2290 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[32023] The complementary binding of VGAM2290 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2290 host target RNA, herein designated VGAM

HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2290 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2290 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[32024] It is appreciated that VGAM2290 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2290 host target genes. The mRNA of each one of this plurality of VGAM2290 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2290 RNA, herein designated VGAM RNA, and which when bound by VGAM2290 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2290 host target proteins.

[32025] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2290 gene, herein designated VGAM GENE, on one or more VGAM2290 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove

with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[32026] It is yet further appreciated that a function of VGAM2290 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2290 include diagnosis, prevention and treatment of viral infection by Murine hepatitis virus. Specific functions, and accordingly utilities, of VGAM2290 correlate with, and may be deduced from, the identity of the host target genes which VGAM2290 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[32027] Nucleotide sequences of the VGAM2290 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2290 RNA, herein designated VGAM RNA, and

a schematic representation of the secondary folding of VGAM2290 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2290 are further described hereinbelow with reference to Table 1.

[32028] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2290 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[32029] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2291 (VGAM2291) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[32030] VGAM2291 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2291 was detected is described hereinabove with reference to Figs. 2-8.

[32031] VGAM2291 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Murine hepatitis virus.

VGAM2291 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[32032] VGAM2291 gene, herein designated VGAM GENE, encodes a VGAM2291 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2291 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2291 precursor RNA is designated SEQ ID:2277, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2277 is located at position 15049 relative to the genome of Murine hepatitis virus.

[32033] VGAM2291 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2291 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of

the second half thereof.

[32034] An enzyme complex designated DICER COMPLEX, dices the VGAM2291 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2291 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide sequence of VGAM2291 RNA is designated SEQ ID:5002, and is provided hereinbelow with reference to the sequence listing part.

[32035] VGAM2291 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2291 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2291 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[32036] VGAM2291 RNA, herein designated VGAM RNA, binds

complementarily to one or more host target binding sites located in untranslated regions of VGAM2291 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2291 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2291 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2291 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[32037] The complementary binding of VGAM2291 RNA, herein designated VGAM RNA, to host target binding sites on

VGAM2291 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2291 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2291 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[32038] It is appreciated that VGAM2291 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2291 host target genes. The mRNA of each one of this plurality of VGAM2291 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2291 RNA, herein designated VGAM RNA, and which when bound by VGAM2291 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2291 host target proteins.

[32039] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2291 gene, herein designated VGAM GENE, on one or more VGAM2291 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other

known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[32040] It is yet further appreciated that a function of VGAM2291 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2291 include diagnosis, prevention and treatment of viral infection by Murine hepatitis virus. Specific functions, and accordingly utilities, of VGAM2291 correlate with, and may be deduced from, the identity of the host target genes which VGAM2291 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[32041] Nucleotide sequences of the VGAM2291 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the

diced VGAM2291 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2291 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2291 are further described hereinbelow with reference to Table 1.

[32042] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2291 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[32043] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2292 (VGAM2292) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[32044] VGAM2292 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2292 was detected is described hereinabove with reference to Figs. 2-8.

[32045] VGAM2292 gene, herein designated VGAM GENE, is a viral

gene contained in the genome of Murine hepatitis virus. VGAM2292 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[32046] VGAM2292 gene, herein designated VGAM GENE, encodes a VGAM2292 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2292 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2292 precursor RNA is designated SEQ ID:2278, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2278 is located at position 5645 relative to the genome of Murine hepatitis virus.

[32047] VGAM2292 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2292 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial

inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[32048] An enzyme complex designated DICER COMPLEX, dices the VGAM2292 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2292 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 49%) nucleotide sequence of VGAM2292 RNA is designated SEQ ID:5003, and is provided hereinbelow with reference to the sequence listing part.

[32049] VGAM2292 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2292 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2292 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[32050] VGAM2292 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2292 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2292 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2292 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2292 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[32051] The complementary binding of VGAM2292 RNA, herein

designated VGAM RNA, to host target binding sites on VGAM2292 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2292 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2292 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[32052] It is appreciated that VGAM2292 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2292 host target genes. The mRNA of each one of this plurality of VGAM2292 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2292 RNA, herein designated VGAM RNA, and which when bound by VGAM2292 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2292 host target proteins.

[32053] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2292 gene, herein designated VGAM GENE, on one or more VGAM2292 host target gene, herein designated

VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[32054] It is yet further appreciated that a function of VGAM2292 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2292 include diagnosis, prevention and treatment of viral infection by Murine hepatitis virus. Specific functions, and accordingly utilities, of VGAM2292 correlate with, and may be deduced from, the identity of the host target genes which VGAM2292 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[32055] Nucleotide sequences of the VGAM2292 precursor RNA,

herein designated VGAM PRECURSOR RNA, and of the diced VGAM2292 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2292 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2292 are further described hereinbelow with reference to Table 1.

[32056] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2292 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[32057] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2293 (VGAM2293) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[32058] VGAM2293 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2293 was detected is described hereinabove with reference to Figs. 2-8.

[32059] VGAM2293 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Murine hepatitis virus. VGAM2293 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[32060] VGAM2293 gene, herein designated VGAM GENE, encodes a VGAM2293 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2293 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2293 precursor RNA is designated SEQ ID:2279, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2279 is located at position 25465 relative to the genome of Murine hepatitis virus.

[32061] VGAM2293 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2293 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the

RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[32062] An enzyme complex designated DICER COMPLEX, dices the VGAM2293 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2293 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 76%) nucleotide sequence of VGAM2293 RNA is designated SEQ ID:5004, and is provided hereinbelow with reference to the sequence listing part.

[32063] VGAM2293 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2293 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2293 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN COD-

ING and 3UTR respectively.

[32064] VGAM2293 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2293 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2293 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2293 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2293 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[32065] The complementary binding of VGAM2293 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2293 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2293 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2293 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[32066] It is appreciated that VGAM2293 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2293 host target genes. The mRNA of each one of this plurality of VGAM2293 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2293 RNA, herein designated VGAM RNA, and which when bound by VGAM2293 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2293 host target proteins.

[32067] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2293 gene, herein designated VGAM GENE, on one

or more VGAM2293 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[32068] It is yet further appreciated that a function of VGAM2293 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2293 include diagnosis, prevention and treatment of viral infection by Murine hepatitis virus. Specific functions, and accordingly utilities, of VGAM2293 correlate with, and may be deduced from, the identity of the host target genes which VGAM2293 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[32069] Nucleotide sequences of the VGAM2293 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2293 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2293 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2293 are further described hereinbelow with reference to Table 1.

[32070] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2293 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[32071] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2294 (VGAM2294) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[32072] VGAM2294 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2294 was detected is de-

scribed hereinabove with reference to Figs. 2-8.

[32073] VGAM2294 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Murine hepatitis virus. VGAM2294 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[32074] VGAM2294 gene, herein designated VGAM GENE, encodes a VGAM2294 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2294 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2294 precursor RNA is designated SEQ ID:2280, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2280 is located at position 22784 relative to the genome of Murine hepatitis virus.

[32075] VGAM2294 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2294 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the

fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[32076] An enzyme complex designated DICER COMPLEX, dices the VGAM2294 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2294 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 44%) nucleotide sequence of VGAM2294 RNA is designated SEQ ID:5005, and is provided hereinbelow with reference to the sequence listing part.

[32077] VGAM2294 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2294 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2294 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and

a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[32078] VGAM2294 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2294 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2294 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2294 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2294 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both

3UTR and 5UTR regions.

[32079] The complementary binding of VGAM2294 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2294 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2294 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2294 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[32080] It is appreciated that VGAM2294 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2294 host target genes. The mRNA of each one of this plurality of VGAM2294 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2294 RNA, herein designated VGAM RNA, and which when bound by VGAM2294 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2294 host target proteins.

[32081] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by

VGAM2294 gene, herein designated VGAM GENE, on one or more VGAM2294 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[32082] It is yet further appreciated that a function of VGAM2294 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2294 include diagnosis, prevention and treatment of viral infection by Murine hepatitis virus. Specific functions, and accordingly utilities, of VGAM2294 correlate with, and may be deduced from, the identity of the host target genes which VGAM2294 binds and inhibits, and the function of these host target genes, as

elaborated hereinbelow.

[32083] Nucleotide sequences of the VGAM2294 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2294 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2294 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2294 are further described hereinbelow with reference to Table 1.

[32084] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2294 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[32085] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2295 (VGAM2295) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[32086] VGAM2295 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene.

The method by which VGAM2295 was detected is described hereinabove with reference to Figs. 2-8.

[32087] VGAM2295 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Ectromelia virus. VGAM2295 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[32088] VGAM2295 gene, herein designated VGAM GENE, encodes a VGAM2295 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2295 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2295 precursor RNA is designated SEQ ID:2281, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2281 is located at position 43938 relative to the genome of Ectromelia virus.

[32089] VGAM2295 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2295 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typi-

cal of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[32090] An enzyme complex designated DICER COMPLEX, dices the VGAM2295 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2295 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM2295 RNA is designated SEQ ID:5006, and is provided hereinbelow with reference to the sequence listing part.

[32091] VGAM2295 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2295 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2295 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding

gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[32092] VGAM2295 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2295 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2295 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2295 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2295 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be lo-

cated in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[32093] The complementary binding of VGAM2295 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2295 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2295 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2295 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[32094] It is appreciated that VGAM2295 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2295 host target genes. The mRNA of each one of this plurality of VGAM2295 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2295 RNA, herein designated VGAM RNA, and which when bound by VGAM2295 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2295 host target proteins.

[32095] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with

specific reference to translational inhibition exerted by VGAM2295 gene, herein designated VGAM GENE, on one or more VGAM2295 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[32096] It is yet further appreciated that a function of VGAM2295 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2295 include diagnosis, prevention and treatment of viral infection by Ectromelia virus. Specific functions, and accordingly utilities, of VGAM2295 correlate with, and may be deduced from, the identity of the host target genes which VGAM2295 binds and inhibits,

and the function of these host target genes, as elaborated hereinbelow.

[32097] Nucleotide sequences of the VGAM2295 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2295 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2295 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2295 are further described hereinbelow with reference to Table 1.

[32098] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2295 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[32099] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2296 (VGAM2296) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[32100] VGAM2296 is a novel bioinformatically detected regula-

tory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2296 was detected is described hereinabove with reference to Figs. 2-8.

[32101] VGAM2296 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Ectromelia virus. VGAM2296 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[32102] VGAM2296 gene, herein designated VGAM GENE, encodes a VGAM2296 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2296 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2296 precursor RNA is designated SEQ ID:2282, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2282 is located at position 27612 relative to the genome of Ectromelia virus.

[32103] VGAM2296 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2296 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure.

As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[32104] An enzyme complex designated DICER COMPLEX, dices the VGAM2296 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2296 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM2296 RNA is designated SEQ ID:5007, and is provided hereinbelow with reference to the sequence listing part.

[32105] VGAM2296 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2296 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2296 host target RNA, herein designated VGAM HOST TARGET RNA, comprises

three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[32106] VGAM2296 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2296 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2296 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2296 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2296 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an

example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[32107] The complementary binding of VGAM2296 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2296 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2296 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2296 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[32108] It is appreciated that VGAM2296 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2296 host target genes. The mRNA of each one of this plurality of VGAM2296 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2296 RNA, herein designated VGAM RNA, and which when bound by VGAM2296 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2296 host target proteins.

[32109] It is further appreciated by one skilled in the art that the

mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2296 gene, herein designated VGAM GENE, on one or more VGAM2296 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[32110] It is yet further appreciated that a function of VGAM2296 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2296 include diagnosis, prevention and treatment of viral infection by Ectromelia virus. Specific functions, and accordingly utilities, of VGAM2296 correlate with, and may be deduced from, the identity of the

host target genes which VGAM2296 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[32111] Nucleotide sequences of the VGAM2296 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2296 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2296 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2296 are further described hereinbelow with reference to Table 1.

[32112] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2296 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[32113] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2297 (VGAM2297) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[32114] VGAM2297 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2297 was detected is described hereinabove with reference to Figs. 2-8.

[32115] VGAM2297 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Ectromelia virus. VGAM2297 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[32116] VGAM2297 gene, herein designated VGAM GENE, encodes a VGAM2297 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2297 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2297 precursor RNA is designated SEQ ID:2283, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2283 is located at position 28555 relative to the genome of Ectromelia virus.

[32117] VGAM2297 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2297 folded precursor RNA, herein designated VGAM FOLDED PRECUR-

SOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[32118] An enzyme complex designated DICER COMPLEX, dices the VGAM2297 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2297 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM2297 RNA is designated SEQ ID:5008, and is provided hereinbelow with reference to the sequence listing part.

[32119] VGAM2297 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2297 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2297 host target RNA,

herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[32120] VGAM2297 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2297 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2297 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2297 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2297 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host tar-

get binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[32121] The complementary binding of VGAM2297 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2297 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2297 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2297 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[32122] It is appreciated that VGAM2297 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2297 host target genes. The mRNA of each one of this plurality of VGAM2297 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2297 RNA, herein designated VGAM RNA, and which when bound by VGAM2297 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2297 host target proteins.

[32123] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2297 gene, herein designated VGAM GENE, on one or more VGAM2297 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[32124] It is yet further appreciated that a function of VGAM2297 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2297 include diagnosis, prevention and treatment of viral infection by Ectromelia virus. Specific functions, and accordingly utilities, of VGAM2297 corre-

late with, and may be deduced from, the identity of the host target genes which VGAM2297 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[32125] Nucleotide sequences of the VGAM2297 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2297 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2297 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2297 are further described hereinbelow with reference to Table 1.

[32126] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2297 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[32127] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2298 (VGAM2298) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the

art.

[32128] VGAM2298 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2298 was detected is described hereinabove with reference to Figs. 2-8.

[32129] VGAM2298 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Ectromelia virus. VGAM2298 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[32130] VGAM2298 gene, herein designated VGAM GENE, encodes a VGAM2298 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2298 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2298 precursor RNA is designated SEQ ID:2284, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2284 is located at position 32155 relative to the genome of Ectromelia virus.

[32131] VGAM2298 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2298 folded

precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[32132] An enzyme complex designated DICER COMPLEX, dices the VGAM2298 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2298 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM2298 RNA is designated SEQ ID:5009, and is provided hereinbelow with reference to the sequence listing part.

[32133] VGAM2298 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2298 host target RNA, herein designated

VGAM HOST TARGET RNA. VGAM2298 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[32134] VGAM2298 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2298 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2298 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2298 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2298 host target RNA, herein designated VGAM HOST TARGET RNA.

It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[32135] The complementary binding of VGAM2298 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2298 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2298 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2298 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[32136] It is appreciated that VGAM2298 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2298 host target genes. The mRNA of each one of this plurality of VGAM2298 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2298 RNA, herein designated VGAM RNA, and which when bound by VGAM2298 RNA, herein designated VGAM RNA, causes inhibition of translation of

respective one or more VGAM2298 host target proteins.

[32137] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2298 gene, herein designated VGAM GENE, on one or more VGAM2298 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[32138] It is yet further appreciated that a function of VGAM2298 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2298 include diagnosis, prevention and treatment of viral infection by Ectromelia virus. Specific

functions, and accordingly utilities, of VGAM2298 correlate with, and may be deduced from, the identity of the host target genes which VGAM2298 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[32139] Nucleotide sequences of the VGAM2298 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2298 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2298 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2298 are further described hereinbelow with reference to Table 1.

[32140] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2298 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[32141] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2299 (VGAM2299) viral gene, which modulates expression of respective host target genes thereof, the func-

tion and utility of which host target genes is known in the art.

[32142] VGAM2299 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2299 was detected is described hereinabove with reference to Figs. 2-8.

[32143] VGAM2299 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Ectromelia virus. VGAM2299 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[32144] VGAM2299 gene, herein designated VGAM GENE, encodes a VGAM2299 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2299 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2299 precursor RNA is designated SEQ ID:2285, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2285 is located at position 23346 relative to the genome of Ectromelia virus.

[32145] VGAM2299 precursor RNA, herein designated VGAM PRE-

CURSOR RNA, folds onto itself, forming VGAM2299 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[32146] An enzyme complex designated DICER COMPLEX, dices the VGAM2299 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2299 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM2299 RNA is designated SEQ ID:5010, and is provided hereinbelow with reference to the sequence listing part.

[32147] VGAM2299 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger

RNA, VGAM2299 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2299 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[32148] VGAM2299 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2299 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2299 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2299 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2299 host

target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[32149] The complementary binding of VGAM2299 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2299 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2299 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2299 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[32150] It is appreciated that VGAM2299 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2299 host target genes. The mRNA of each one of this plurality of VGAM2299 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2299 RNA, herein designated VGAM RNA, and which when bound by VGAM2299 RNA, herein

designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2299 host target proteins.

[32151] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2299 gene, herein designated VGAM GENE, on one or more VGAM2299 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[32152] It is yet further appreciated that a function of VGAM2299 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2299 include diagnosis, prevention and

treatment of viral infection by Ectromelia virus. Specific functions, and accordingly utilities, of VGAM2299 correlate with, and may be deduced from, the identity of the host target genes which VGAM2299 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[32153] Nucleotide sequences of the VGAM2299 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2299 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2299 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2299 are further described hereinbelow with reference to Table 1.

[32154] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2299 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[32155] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2300 (VGAM2300) viral gene, which modulates ex-

pression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[32156] VGAM2300 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2300 was detected is described hereinabove with reference to Figs. 2-8.

[32157] VGAM2300 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Ectromelia virus. VGAM2300 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[32158] VGAM2300 gene, herein designated VGAM GENE, encodes a VGAM2300 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2300 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2300 precursor RNA is designated SEQ ID:2286, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2286 is located at position 38978 relative to the genome of Ectromelia virus.

[32159] VGAM2300 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2300 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[32160] An enzyme complex designated DICER COMPLEX, dices the VGAM2300 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2300 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 58%) nucleotide sequence of VGAM2300 RNA is designated SEQ ID:5011, and is provided hereinbelow with reference to the sequence listing part.

[32161] VGAM2300 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2300 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2300 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[32162] VGAM2300 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2300 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2300 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2300 RNA, herein designated VGAM RNA, may have a different number of host target

binding sites in untranslated regions of a VGAM2300 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[32163] The complementary binding of VGAM2300 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2300 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2300 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2300 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[32164] It is appreciated that VGAM2300 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2300 host target genes. The mRNA of each one of this plurality of VGAM2300 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2300 RNA, herein designated VGAM

RNA, and which when bound by VGAM2300 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2300 host target proteins.

[32165] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2300 gene, herein designated VGAM GENE, on one or more VGAM2300 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[32166] It is yet further appreciated that a function of VGAM2300 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly,

utilities of VGAM2300 include diagnosis, prevention and treatment of viral infection by Ectromelia virus. Specific functions, and accordingly utilities, of VGAM2300 correlate with, and may be deduced from, the identity of the host target genes which VGAM2300 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[32167] Nucleotide sequences of the VGAM2300 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2300 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2300 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2300 are further described hereinbelow with reference to Table 1.

[32168] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2300 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[32169] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Mes-

senger 2301 (VGAM2301) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[32170] VGAM2301 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2301 was detected is described hereinabove with reference to Figs. 2-8.

[32171] VGAM2301 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Ectromelia virus. VGAM2301 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[32172] VGAM2301 gene, herein designated VGAM GENE, encodes a VGAM2301 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2301 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2301 precursor RNA is designated SEQ ID:2287, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2287 is located at position

30387 relative to the genome of Ectromelia virus.

[32173] VGAM2301 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2301 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[32174] An enzyme complex designated DICER COMPLEX, dices the VGAM2301 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2301 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM2301 RNA is designated SEQ ID:5012, and is provided hereinbelow with reference to the sequence listing part.

[32175] VGAM2301 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2301 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2301 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[32176] VGAM2301 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2301 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2301 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2301 RNA, herein designated

VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2301 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[32177] The complementary binding of VGAM2301 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2301 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2301 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2301 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[32178] It is appreciated that VGAM2301 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2301 host target genes. The mRNA of each one of this plurality of VGAM2301 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly com-

plementary to VGAM2301 RNA, herein designated VGAM RNA, and which when bound by VGAM2301 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2301 host target proteins.

[32179] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2301 gene, herein designated VGAM GENE, on one or more VGAM2301 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[32180] It is yet further appreciated that a function of VGAM2301 is inhibition of expression of host target genes, as part of

a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2301 include diagnosis, prevention and treatment of viral infection by Ectromelia virus. Specific functions, and accordingly utilities, of VGAM2301 correlate with, and may be deduced from, the identity of the host target genes which VGAM2301 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[32181] Nucleotide sequences of the VGAM2301 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2301 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2301 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2301 are further described hereinbelow with reference to Table 1.

[32182] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2301 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[32183] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present

invention, referred to here as Viral Genomic Address Messenger 2302 (VGAM2302) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[32184] VGAM2302 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2302 was detected is described hereinabove with reference to Figs. 2-8.

[32185] VGAM2302 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Ectromelia virus. VGAM2302 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[32186] VGAM2302 gene, herein designated VGAM GENE, encodes a VGAM2302 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2302 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2302 precursor RNA is designated SEQ ID:2288, and is provided hereinbelow with reference to the sequence listing part. Nu-

cleotide sequence SEQ ID:2288 is located at position 44731 relative to the genome of Ectromelia virus.

[32187] VGAM2302 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2302 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[32188] An enzyme complex designated DICER COMPLEX, dices the VGAM2302 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2302 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM2302 RNA is designated SEQ ID:5013, and is provided hereinbelow with reference to the sequence

listing part.

[32189] VGAM2302 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2302 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2302 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[32190] VGAM2302 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2302 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2302 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not

meant to be limiting VGAM2302 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2302 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[32191] The complementary binding of VGAM2302 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2302 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2302 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2302 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[32192] It is appreciated that VGAM2302 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2302 host target genes. The mRNA of each one of this plurality of VGAM2302 host target genes comprises one or more host target binding sites, each

having a nucleotide sequence which is at least partly complementary to VGAM2302 RNA, herein designated VGAM RNA, and which when bound by VGAM2302 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2302 host target proteins.

[32193] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2302 gene, herein designated VGAM GENE, on one or more VGAM2302 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[32194] It is yet further appreciated that a function of VGAM2302

is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2302 include diagnosis, prevention and treatment of viral infection by Ectromelia virus. Specific functions, and accordingly utilities, of VGAM2302 correlate with, and may be deduced from, the identity of the host target genes which VGAM2302 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[32195] Nucleotide sequences of the VGAM2302 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2302 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2302 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2302 are further described hereinbelow with reference to Table 1.

[32196] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2302 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[32197] Fig. 1 further provides a conceptual description of another

novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2303 (VGAM2303) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[32198] VGAM2303 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2303 was detected is described hereinabove with reference to Figs. 2-8.

[32199] VGAM2303 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Ectromelia virus. VGAM2303 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[32200] VGAM2303 gene, herein designated VGAM GENE, encodes a VGAM2303 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2303 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2303 precursor RNA is designated SEQ ID:2289, and is provided here-

inbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2289 is located at position 38706 relative to the genome of Ectromelia virus.

[32201] VGAM2303 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2303 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[32202] An enzyme complex designated DICER COMPLEX, dices the VGAM2303 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2303 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 44%) nucleotide sequence of VGAM2303 RNA is designated SEQ ID:5014, and

is provided hereinbelow with reference to the sequence listing part.

[32203] VGAM2303 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2303 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2303 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[32204] VGAM2303 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2303 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2303 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites

shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2303 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2303 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[32205] The complementary binding of VGAM2303 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2303 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2303 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2303 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[32206] It is appreciated that VGAM2303 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2303 host target genes. The mRNA of each one of this plurality of VGAM2303 host target genes

comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2303 RNA, herein designated VGAM RNA, and which when bound by VGAM2303 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2303 host target proteins.

[32207] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2303 gene, herein designated VGAM GENE, on one or more VGAM2303 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[32208] It is yet further appreciated that a function of VGAM2303 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2303 include diagnosis, prevention and treatment of viral infection by Ectromelia virus. Specific functions, and accordingly utilities, of VGAM2303 correlate with, and may be deduced from, the identity of the host target genes which VGAM2303 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[32209] Nucleotide sequences of the VGAM2303 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2303 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2303 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2303 are further described hereinbelow with reference to Table 1.

[32210] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2303 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[32211] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2304 (VGAM2304) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[32212] VGAM2304 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2304 was detected is described hereinabove with reference to Figs. 2-8.

[32213] VGAM2304 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Ectromelia virus. VGAM2304 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[32214] VGAM2304 gene, herein designated VGAM GENE, encodes a VGAM2304 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2304 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2304 precur-

sor RNA is designated SEQ ID:2290, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2290 is located at position 35690 relative to the genome of Ectromelia virus.

[32215] VGAM2304 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2304 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[32216] An enzyme complex designated DICER COMPLEX, dices the VGAM2304 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2304 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 53%) nucleotide se-

quence of VGAM2304 RNA is designated SEQ ID:5015, and is provided hereinbelow with reference to the sequence listing part.

[32217] VGAM2304 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2304 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2304 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[32218] VGAM2304 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2304 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2304 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is ap-

preciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2304 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2304 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[32219] The complementary binding of VGAM2304 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2304 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2304 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2304 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[32220] It is appreciated that VGAM2304 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2304 host target genes. The mRNA of

each one of this plurality of VGAM2304 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2304 RNA, herein designated VGAM RNA, and which when bound by VGAM2304 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2304 host target proteins.

[32221] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2304 gene, herein designated VGAM GENE, on one or more VGAM2304 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science

294,779 (2001)).

[32222] It is yet further appreciated that a function of VGAM2304 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2304 include diagnosis, prevention and treatment of viral infection by Ectromelia virus. Specific functions, and accordingly utilities, of VGAM2304 correlate with, and may be deduced from, the identity of the host target genes which VGAM2304 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[32223] Nucleotide sequences of the VGAM2304 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2304 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2304 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2304 are further described hereinbelow with reference to Table 1.

[32224] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2304 RNA, herein designated VGAM RNA, are de-

scribed hereinbelow with reference to Table 2.

[32225] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2305 (VGAM2305) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[32226] VGAM2305 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2305 was detected is described hereinabove with reference to Figs. 2-8.

[32227] VGAM2305 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Camelpox virus. VGAM2305 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[32228] VGAM2305 gene, herein designated VGAM GENE, encodes a VGAM2305 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2305 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly

similar to the nucleotide sequence of VGAM2305 precursor RNA is designated SEQ ID:2291, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2291 is located at position 38932 relative to the genome of Camelpox virus.

[32229] VGAM2305 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2305 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[32230] An enzyme complex designated DICER COMPLEX, dices the VGAM2305 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2305 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other

necessary proteins. A probable (over 48%) nucleotide sequence of VGAM2305 RNA is designated SEQ ID:5016, and is provided hereinbelow with reference to the sequence listing part.

[32231] VGAM2305 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2305 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2305 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[32232] VGAM2305 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2305 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2305 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I,

BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2305 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2305 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[32233] The complementary binding of VGAM2305 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2305 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2305 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2305 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[32234] It is appreciated that VGAM2305 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents

a plurality of VGAM2305 host target genes. The mRNA of each one of this plurality of VGAM2305 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2305 RNA, herein designated VGAM RNA, and which when bound by VGAM2305 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2305 host target proteins.

[32235] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2305 gene, herein designated VGAM GENE, on one or more VGAM2305 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[32236] It is yet further appreciated that a function of VGAM2305 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2305 include diagnosis, prevention and treatment of viral infection by Camelpox virus. Specific functions, and accordingly utilities, of VGAM2305 correlate with, and may be deduced from, the identity of the host target genes which VGAM2305 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[32237] Nucleotide sequences of the VGAM2305 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2305 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2305 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2305 are further described hereinbelow with reference to Table 1.

[32238] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites

to VGAM2305 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[32239] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2306 (VGAM2306) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[32240] VGAM2306 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2306 was detected is described hereinabove with reference to Figs. 2-8.

[32241] VGAM2306 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Ectromelia virus. VGAM2306 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[32242] VGAM2306 gene, herein designated VGAM GENE, encodes a VGAM2306 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2306 precursor RNA, herein designated VGAM PRECURSOR RNA, does not en-

code a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2306 precursor RNA is designated SEQ ID:2292, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2292 is located at position 43278 relative to the genome of Ectromelia virus.

[32243] VGAM2306 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2306 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[32244] An enzyme complex designated DICER COMPLEX, dices the VGAM2306 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2306 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide sequence of VGAM2306 RNA is designated SEQ ID:5017, and is provided hereinbelow with reference to the sequence listing part.

[32245] VGAM2306 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2306 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2306 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[32246] VGAM2306 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2306 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2306 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3

such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2306 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2306 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[32247] The complementary binding of VGAM2306 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2306 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2306 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2306 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[32248] It is appreciated that VGAM2306 host target gene, herein

designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2306 host target genes. The mRNA of each one of this plurality of VGAM2306 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2306 RNA, herein designated VGAM RNA, and which when bound by VGAM2306 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2306 host target proteins.

[32249] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2306 gene, herein designated VGAM GENE, on one or more VGAM2306 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these

other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[32250] It is yet further appreciated that a function of VGAM2306 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2306 include diagnosis, prevention and treatment of viral infection by Ectromelia virus. Specific functions, and accordingly utilities, of VGAM2306 correlate with, and may be deduced from, the identity of the host target genes which VGAM2306 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[32251] Nucleotide sequences of the VGAM2306 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2306 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2306 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2306 are further described hereinbelow with reference to Table 1.

[32252] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the

complementarity of each of these host target binding sites to VGAM2306 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[32253] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2307 (VGAM2307) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[32254] VGAM2307 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2307 was detected is described hereinabove with reference to Figs. 2-8.

[32255] VGAM2307 gene, herein designated VGAM GENE, is a viral gene contained in the genome of lumpy skin disease virus. VGAM2307 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[32256] VGAM2307 gene, herein designated VGAM GENE, encodes a VGAM2307 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2307 precursor RNA,
